Comment # 173 **Comment submitted by:** Ran Yaniv

Comment Type Technical, Binding **Starting Page #** 91 **Starting Line #** **Fig/Table#** **Section** 8.4.6.1.2.1

A well-designed permutation should minimize the hit ratio between any two subchannels. However, the hit ratio of PUSC in reuse 1/3 configuration is such that a single subchannel in one cell may be hit by the same subchannel in the neighbor cell in as many as 38% of its tones.

Additional problems with PUSC permutation:

The standard deviation of the hit count on a subchannel is high and itself varies widely between different subchannels and IDcell pairs.
The number of different permutation sequences is restricted to 8 due to the size of the odd major groups.

Suggested Remedy

Adopt contribution 802.16maint-05/083 ("Hit Ratio Problems with PUSC Permutation").

Comment # 175 **Comment submitted by:** Ran Yaniv

Comment Type Technical, Binding **Starting Page #** 92 **Starting Line #** 17 **Fig/Table#** **Section** 8.4.6.1.2.1.1

Several changes to the PUSC permutation IDcell values were adopted in session #35 as a result of contribution maint-04/72r3. As a result, the IDcell for the outer permutation in the first DL zone is now 0 and for the inner permutation it is now specified by the preamble IDcell.

The accepted solution is not satisfactory in the sense that it forces a reuse-3 deployment on the first zone, while the standard is clearly built to support unplanned frequency reuse-1 in other zones (FUSC, PUSC with 'use all SC', optional FUSC). The need to plan the deployment for the first zone takes most of the sting about of the standard's support for reuse-1.

A possible solution is to have the outer permutation in the first zone behave differently based on the LSB of the preamble IDcell. For example:
IDcell of outer permutation for 1st DL zone = 0 if LSB = 0;
IDcell of outer permutation for 1st DL zone = preamble IDcell (as is the case for zones with 'use all SC=1') if LSB = 1

Suggested Remedy

clarify the support for reuse-1 on the first DL zone:

[modify the text on page 92, lines 17-20 as follows:]

In the first PUSC zone of the downlink (first downlink zone)**,** the default used DL_PermBase is **equal to** 0 **when the LSB of the preamble IDcell is 0, and is equal to the preamble IDcell when the LSB is 1**. When the 'Use all SC indicator=0' in the STC_DL_Zone_IE(), DL_PermBase is replaced with 0. For All other cases DL_PermBase parameter in the STC_DL_Zone_IE() shall be used.

Comment # 179 **Comment submitted by:** Ran Yaniv

Comment Type Technical, Binding **Starting Page #** 93 **Starting Line #** 38 **Fig/Table#** **Section** 8.4.6.1.2.2.2

The in-slot subcarrier rotations in both DL-PUSC and UL-PUSC permutations are clearly not suited for repetition codes. When repetition occurs over time, repeated bits are placed on the same subcarrier rather than on different subcarriers. As a result, repetition does not combat the fading properties of the channel.

This problem occurs with DL-PUSC and with UL-PUSC when the subchannel rotation scheme is not applied (optional UL PUSC, AAS mode).

Suggested Remedy

change PUSC so that in-slot rotation takes both time and frequency into account:

1) [modify the text on page 569, lines 59-61of 802.16-REVd/D5 as follows:]

s is the index number of a subchannel, from the set [0...Nsubchannels-1]
t is the index number of the slot-duration within the zone; the first slot-duration has index 0
nk = (k + 13 · **(**s **+ t)**) mod Nsubcarriers

2) [modify the text on page 573, lines 21-29 of 802.16-REVd/D5 as follows:]

subcarrier(n, s) = (n + 13 · **(**s **+ t)**)modNsubcarriers

where

n is a running index 0…47
s is the subchannel number.
t is the index number of the slot-duration within the zone; the first slot-duration has index 0
Nsubcarriers is the number of subcarriers per subchannel.

Comment # 004 **Comment submitted by:** Jing Wang 2005-04-22

Comment Type Technical, Binding **Starting Page #** **Starting Line #** **Fig/Table#** **Section** 8.4.4.2

In the current standard how pilot tones are modulated using the PRBS generation is not specified. For example, is PRBS assigned in physical or logical numbering? It is not clear, in PUSC mode, whether PRBS is assigned to only specific segments or all the sub-carriers, including DC.

Suggested Remedy

One solution is to apply PRBS to all the sub-carriers, starting from first used one, in physical number ordering. Alternatively,
in the downlink, for PUSC, FUSC, AMC, and optional FUSC permutation, pilot tones are logically renumbered freqeuncy-domain first (starting from the lowest numbered subcarrier) then time (starting from the lowest numbered OFDMA symbol). In PUSC only pilot tones of clusters assigned to the specific segments are logically sequenced and pilot tones are not subject to cluster renumbering. After pilot tones are logically sequenced, the PRBS sequence described in 8.4.9.4.1 are mapped to the pilot tones.

Proposed Resolution **Recommendation:** **Recommendation by**

Reason for Recommendation

Resolution of Group **Decision of Group:** **Accepted-Modified**

On page 144, line 48, append the sentence:

"A new value shall be generated by the PRBS for every subcarrier up to the highest numbered usable subcarrier, in order of physical subcarriers, including the DC subcarrier and usable subcarriers that are not allocated."

Comment # 019 Comment submitted by: David Castelow 2005-04-22

Comment Type Technical, Binding Starting Page # 13 Starting Line # 25 Fig/Table# Section 6.3.2.3

Rejection of comment 13 means ambiguity remains.

(a) the 802.1Q standard in force when .16-2004 was published was .1Q-2003, so there are at very least editorial corrections to be made.

The draft document is incomplete because it does not deal with the following problem.
The definition of the contents of the 802.3/Ethernet PDU are ambiguous because of the definitions of frames in 802.3.
In 802.3 there is a definition of an entire frame. This includes the inter-frame gap, the preamble at the beginning and the FCS at the end. However there is no definition in that standard of an entity that includes the necessary components (e.g. source and destination MAC address) and does not include these extraneous items. Therefore 802.16 needs to be explicit about what data is included.

See contribution C80216maint-05/075r5 for further supporting argument and technical changes.

Suggested Remedy

Adopt contribution C80216maint-05/075r5.

Also fix references to current version of 802.1Q (2003, not 1998).
Replace page 8, line 14, with the following:
5.2.5 IEEE Std 802.1Q~~-1998~~2003 virtual local area network (VLAN) specific part
This CS shall be employed when IEEE Std 802.1Q~~-1998~~2003 tagged VLAN frames are to be carried over the IEEE Std 802.16 network.

Page 8, line 16, modify as follows:
5.2.5.1 IEEE Std 802.1Q~~-1998~~2003 VLAN CS PDU format

Page 8, line 21, modify as follows:
The format of the IEEE Std 802.1Q~~-1998~~2003 VLAN CS PDU shall be as shown in Figure 14 (when header suppression is enabled at the connection but not applied to the CS PDU) or Figure 15 (with header suppression). In the case PHS is not enabled, PHSI field shall be omitted.

Replace Page 9, line 1 to line 8 with the following:
5.2.5.2 IEEE Std 802.1Q~~-1998~~2003 CS classifiers
The following parameters are relevant for IEEE Std 802.1Q~~-1998~~2003 CS classifiers:
~~LC~~IEEE Std 802.3/Ethernet header classification parameters-zero or more of the~~LLC~~IEEE Std 802.3/Ethernet header classification parameters (Destination MAC address, source MAC address, Ethertype/SAP).

IEEE Std 802.1D~~-1998~~2003Parameters-zero or more of the IEEE classification parameters (IEEE Std 802.1D~~-1998~~2003 Priority Range, IEEE Std 802.1Q~~-1998~~2003VLAN ID).
For IP over IEEE Std 802.1Q~~-1998~~2003 VLAN, IP headers may be included in classification. In this case, the IP classification parameters

For IP over IEEE Std 802.1Q-1998/2003 VLAN, IP headers may be included in classification. In this case, the IP classification parameters (11.13.19.3.4.2-11.13.19.3.4.7) are allowed.

Comment # 118 **Comment submitted by:** Ran Yaniv 2005-04-22

Comment Type Technical, Binding **Starting Page #** 128 **Starting Line #** **Fig/Table#** **Section** 8.4.7

802.16-2004 defines an initial ranging scheme that is based on transmitting either one or two CDMA codes over 6 subchannels (8 with optional PUSC).

However, these schemes do not work when the deployment consists of a multiple-antenna BS (a supported configuration of 802.16-2004) and a power limited SS that requires either repetition or mini-subchannels for its operation. In such scenarios, the code misdetection rate goes as high as 25% misdetection rate for a 1% false alarm rate. With a single-antenna BS, detection performance is only marginal.

These results are obtained under unrealistically optimistic assumptions: time offset is perfectly known, a single code hypothesis, and that there is no contention on the ranging slot.

Suggested Remedy

Consider and adopt contribution C802.16maint-05/094.

Comment # 180 **Comment submitted by:** Ran Yaniv 2005-04-22

Comment Type Technical, Binding **Starting Page #** 163 **Starting Line #** **Fig/Table#** 358 **Section** 11.4.1

Contribution maint-04/72r3, which was accepted during session #35, clarifies the values of 'IDcell' used for the two equations that define the PUSC permutation (cluster permutation and eq. (111), aka 'inner permutation'). The clarification states that for zones with indicator 'use all SC=1', the DL_PermBase value specified in the zone_switch_IE is the one used for both the inner and cluster permutations of PUSC (same DL_PermBase value for both).

I object to the accepted solution since it adds an unneeded restriction to the system. For zones with 'use all SC=1', a separate PermBase value should be used for inner/cluster permutations of PUSC without any additional complexity.
This has merit because it can be shown that PUSC permutation hit-ratio properties depend on the DL_PermBase value used; hence better optimization of hit-ratio can be achieved by selecting distinct PermBase values for the different components of the permutation

Suggested Remedy

[Add the following field to table 358 (DCD channel encodings):]

DL_ClusterPermBase	**21**	**1**	**Value used in the clustering renumbering formula described in section 8.4.6.1.2.1.1, for PUSC zones for which the indicator 'use all SC' = 1.**	**OFDMA**

[modify text on page 92, lines 16-21]

LogicalCluster = RenumberingSequence((PhysicalCluster+13*~~IDcell~~~~DL_PermBase~~ **DL_ClusterPermBase**) mod 120)
~~In the first PUSC zone of the downlink (first downlink zone), the default used IDcell is 0.~~ In the first PUSC zone of the downlink (first downlink zone) the default used DL_**Cluster**PermBase is 0. When the 'Use all SC indicator=0' in the STC_DL_Zone_IE(), DL_**Cluster**PermBase is replaced with 0. For All other cases **DL_ClusterPermBase parameter transmitted in the DCD message shall be used, or, if the parameter was not transmitted in a DCD message, the** DL_PermBase parameter in the STC_DL_Zone_IE() shall be used.

Proposed Resolution **Recommendation:** **Recommendation by**

Reason for Recommendation

[Add the following field to table 358 (DCD channel encodings):]

DL_ClusterPermBase	**21**	**1**	**Value used in the clustering renumbering formula**

described in section 8.4.6.1.2.1.1, for PUSC zones for which the indicator 'use all SC' = 1.

[modify text on page 92, lines 16-21]

LogicalCluster = RenumberingSequence((PhysicalCluster+13*~~IDcell~~~~DL_PermBase~~ **DL_ClusterPermBase**) mod 120)
~~In the first PUSC zone of the downlink (first downlink zone), the default used IDcell is 0.~~ In the first PUSC zone of the downlink (first downlink zone) the default used DL_**Cluster**PermBase is 0. When the 'Use all SC indicator=0' in the STC_DL_Zone_IE(), DL_**Cluster**PermBase is replaced with 0. For All other cases **DL_ClusterPermBase parameter transmitted in the DCD message shall be used, or, if the parameter was not transmitted in a DCD message, the** DL_PermBase parameter in the STC_DL_Zone_IE() shall be used.

Resolution of Group **Decision of Group:** **Rejected**

Reason for Group's Decision/Resolution

Vote to accept the comment:
In favor: 2
Against: 4
Fails

Reason:
Use of the same permutation is to enable macro-diversity multicast/broadcast services when 'use all SC=1'
