Re:  IEEE 802.16j-06/034: "Call for Technical Proposals regarding IEEE Project P802.16j"

Abstract  This contribution proposes a RS grouping technique for enhancing 802.16j system

Purpose  Proposes a RS grouping technique for enhancing 802.16j system

Notice  This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on
        the contributing individual(s) or organization(s). The material in this document is subject to change in form and
        content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained
        herein.

Release  The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution,
         and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name
         any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole
         discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The
         contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

Patent Policy and Procedures  The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures
                           <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known
                           use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or
                           applicant with respect to patents essential for compliance with both mandatory and optional portions of the
                           standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is
                           essential to reduce the possibility for delays in the development process and increase the likelihood that the draft
                           publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as
                           possible, in written or electronic form, if patented technology (or technology under patent application) might be
                           incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose
                           this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>.
A Grouping Scheme of Relay Station for 802.16j

I. INTRODUCTION

In IEEE 802.16j, RSs (relay stations) are developed to provide user-throughput enhancement, coverage extension and/or capacity enhancement to IEEE 802.16e. Deployment of relays, however, may incur issues that are not encountered in IEEE 802.16e. For example, an MS (mobile station) may perform handover more frequently than in the IEEE 802.16e system due to a smaller RS coverage. Also, if RSs are configured to broadcast control signals such as preamble, FCH and MAP in a frame, over-the-air overhead might consume too large a part of the MR-BS’s radio resource. This problem is particularly serious if the number of relays in an MR-cell (multi-hop relay cell) is large. Finally, if a predefined resource is allocated to a specific RS, the resource utilization in an MR-BS would lack of flexibility, and the system trucking efficiency would become lower. In this contribution, a grouping scheme of RSs is proposed for IEEE 802.16j to ease the above-mentioned issues.

II. PROBLEM DEFINITION

In IEEE 802.16j, RSs are developed to provide user throughput enhancement, coverage extension and/or capacity enhancement to IEEE 802.16. Some usage models of RSs were suggested in [1], including fixed infrastructure, in-building coverage, temporary coverage, and coverage on mobile vehicle. In real applications, deployment of RSs may be subject to limitation on the RS transmit power, geography of the service area, etc. For example, two or more RSs in the vicinity of each other may be deployed to provide throughput enhancement over a large urban area and/or to provide coverage extension to a large hole or in an underground. In addition, it would not be uncommon to deploy adjacent RSs along a tunnel or a highway in order to provide complete coverage. Figure 1 illustrates these deployment scenarios, including coverage and/or throughput enhancement (a) to a large urban area, (b) in a tunnel, (c) in an underground, and (d) along a highway.

Figure 1. Deployment scenarios of RSs in IEEE 802.16j
Deployment of RSs may encounter issues that are not met in the traditional cellular systems, including frequent handovers, undue overhead and low system trucking efficiency. The issues are discussed in more detail as follows.

- **Frequent Handovers:** In the IEEE 802.16e system, no handover will be triggered for an MS moving within the cell coverage. In an MR network, however, handover may be initiated when an MS moves across the boundary of RSs. Take Figure 2 as an example, an MS might trigger more than one handover when walking along path (a), (b) or (c). Too often happened handovers would degrade the connection and network performance.

![Figure 2. Example handover scenarios in an MR-cell](image)

- **Undue overhead:** In 802.16j, RSs may need to broadcast control signals such as Preamble, FCH and MAP for the application of coverage extension. Figure 3 illustrates the potential issue with one BS and six RSs in a MR-cell, where P and M stand for Preamble and MAP, respectively. As is obvious, the undue overhead may eat up quite a part of the radio resource.

![Figure 3. Overheads for six RSs in an MR-cell](image)

- **Low trucking efficiency:** In IEEE 802.16j, radio resource may be allotted to RSs in a pre-determined and
III. THE CONCEPT OF RS GROUPING

A set RSs is said to form a RS Group if they transmit the same down-link signals. (A single RS can be considered as a special RS Group which has only one member RS.) For the up-link, each member RS in a RS Group acts like a regular RS. The basic idea behind the grouping is that adjacent RSs could be grouped together as a RS Group that acts like a regular RS in the down-link to its associated MSs or RSs. Since the coverage of a RS Group is larger than the regular member RS, there would be a lower handover frequency. In addition, only one copy of control signal in a frame is needed for a RS Group, the overhead is thus reduced. Finally, the down-link radio resource of each member RS can be aggregated and shared by all the MSs under the grouped RS so that the trucking efficiency is improved.

Figure 4 shows an example MR network incorporating the concept of RS grouping, where the solid line connecting two RS Groups says that they have a direct communication between them. In this example, RS Group 1 consists of RS-1 and RS-2, RS Group 2 consists of RS-5 and RS-6, and RS Group 3 and RS Group 4 are the single-element RS Groups. Note that RS-4 cannot be grouped with RS-5 and RS-6 as a new RS Group because they don’t have same superordinate RS Group.

IV. THE MOBILITY MANAGEMENTS FOR RS GROUPING

For reducing handover occurrences and overheads, a RS Group (e.g. RS Group1) transmits the same preamble and MAP, and the ranging channel in the frame is shared among the RSs in a group in this design.
Besides, MS roams in cell of a grouped RS without initiating HO procedures when changing association from one RS to another. A MS CDMA periodic ranging process with aggregated ranging sub-channel allocation [2] can be employed to handle the RS reselection within coverage of RS Group. Due to the backward compatibility of MS, a RS Group shall act as legacy BS to SSs so that inter-RS Group handover shall be identical to inter-BS handover and the legacy handover procedure can be applied. As a result, handover shall only be triggered in inter-group-RS handover case, not in intra-group-RS case, and handover occurrences and overheads are reduced.

V. POPOSED TEXT

----------------------------------------------Start of Text----------------------------------------------

[Add the following section]

6.3.9.16 Network entry and initialization

6.3.9.16.1 RS network entry and initialization

6.3.9.16.1.x RS grouping

RS grouping method includes the following characteristics:
- RSs are grouped based on the segments selected (or assigned)
- Each group is identified as RS group ID (RS_Group_ID), which is the same format as BS-ID.
- All RSs in the same group shall transmit the identical preamble, FCH, MAP, and Bursts (if necessary).
- A group is viewed as a virtual Station by a MS, and use radio resource, including downlink and uplink traffic, by the indication from BS.
- Different RS groups transmit different preamble, same or different FCH and MAP from that of the associated MR-BS
- A MS and RS shall identify its access point by the indication from MR-BS during network entry.

A relay, at network entry, can either create a new group, i.e., it selects or is assigned a dedicated preamble index (implying the segment) or joins an existing group. The RS can perform measurement of radio environment and then report to MR-BS regarding the preferred preamble index (implying the segment) using a MAC management message. The MR-BS replies by either confirming the preamble selected by the RS or assigning a different one, and at the same time, providing the corresponding RS group ID using a MAC management message.

[Add two new section 6.3.2.3.62 as described]

6.3.2.3.62 RS configuration request (RS_CONF-REQ) message

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Size</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS_CONF-REQ_Message_Format()</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Management Message Type = TBD</strong></td>
<td>8 bits</td>
<td></td>
</tr>
</tbody>
</table>

5
| N_Preamble | 2 bits | N_Preamble=0 specifies NULL preamble (e.g., Transparent RS)  
| N_Preamble=1 assigns one preamble to the RS  
| N_Preamble=2 assigns two preambles on different segments to the RS  
| N_Preamble=3 assigns three preambles on different segments to the RS |
| Reserved | 6 bits | Reserved |
| For (i=0, i<N_Preamble; i++) |  
| Preamble index | 8 bits | Assign a preamble index value to the potential RS |
| TLV Encoded Information | Variable | TLV Specific |

N_Preamble
N_Preamble is the number of preamble index assigned to the potential RS. For example, N_Preamble=0 means the potential RS does not transmit preamble acting as a Transparent RS. If N_Preamble=1 means the potential RS transmit one preamble index (i.e., the RS transmit one segment value and one IDCell) acting as a Non-Transparent RS. If N_Preamble=2 means the potential RS transmit two preamble index (i.e., the RS transmit two different segment values and IDCells) acting as a Non-Transparent RS.

The RS_CONF-REQ shall contain the following TLVs:

HMAC/CMAC Tuple (see 11.1.2)

The HMAC/CMAC Tuple shall be the last attribute in the message.

[Add a new section 6.3.2.3.63 as described]

6.3.2.3.63 RS configuration response (RS_CONF-RSP) message

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Size</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS_CONF-RSP_Message_Format()</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Management Message Type = TBD</td>
<td>8 bits</td>
<td></td>
</tr>
</tbody>
</table>
| Result | 2 bits | 00 : Failure  
| 01 : Accept  
| 10 : Deny  
| 11 : reserved |
| Reserved | 6 bits | |
| TLV Encoded Information | Variable | TLV Specific |

The RS_CONF-RSP shall contain the following TLVs:

HMAC/CMAC Tuple (see 11.1.2)

The HMAC/CMAC Tuple shall be the last attribute in the message.
[Add a new section 9.4 as described]

9.4 RS configuration
After the measurement report from RS neighborhood discovery process, MR-BS may sends a RS preamble configuration request (RS_CONF-REQ) message (6.3.2.3.6) to the RS for configuring the preamble segment and ID-Cell values. The RS sends a RS_CONF-RSP message to the MR-BS for responding the preamble assignment result.

[Add a new section 11.7.27 as described]

11.7.27 RS_capability_support

The “RS_capability_support” field indicates the potential RS capability. A bit of 1 indicates “support RS capability”.
