Multiple Frame and Relay Operation for 802.16 MMR Networks

multiple frame operation with 802.16e legacy frame structure to support multi-hop between MR-BS and RS

1. Introduction

This contribution proposes a multiple frame structure for consistency with the 802.16e legacy frame structure to support multi-hop relay operation which avoids inter-RSs and inter MR-BS and RS interference in field operation.

This contribution has been made under the assumptions as follows:
(1) An MS could be located where significant level of signals are received from more than 2 RSs, or a BS and RSs.
(2) Only one TDD channel is considered in the MR network
(3) No changes is required for IEEE802.16e MS operation

2. Purpose

- to alleviate limitation of hopping count for enhancement of flexible network deployment capability
- to eliminate mutual interference b/w MR-BS and RS, or between RSs
- to minimize the revision of PHY and MAC in legacy BS and MS

3. Proposal for Multi-frame Operation

3.1. Overview

(1) Multi-frame concept
- A Multi-frame consists of $L$ subsequent frames.

$LMF$: length of Multi Frame

The length of Multi-frame($LMF$) is determined before the Multi-frame start time, in consideration of topology and traffic load.

$LMF = \text{the length of Multi-frame} = \max (MHR+1, 2 * MHM - 1)$

$MHR$ : the maximum hop counts of active RSs

$MHM$ : the maximum hop counts of MSs who have at least one UL traffic at start of Multi-frame

Example:
if no RS in a cell, $LMF = \max (0+1, 2-1) = 1$
else if there exist 1-hop RSs and 2-hop MSs {
    if at least an MS has UL data to send, $LMF = \max (1+1, 2*2-1) = 3$
    else no MS has UL data to send, $LMF = \max (1+1, -1) = 2$
}
(3) Sample topology

(fig. 1) A sample for showing network topology and frame transmissions of hop links during $k^{th}$ frame transmission at MR-BS

In figure 1, $k$ is an arbitrary frame sequence number of a Multi-frame with the range of $1 \leq k \leq LMF$ (length of Multi-frame). In addition, before every Multi-frame is transmitted into the air, $k$ shall be renewed and $LMF$ shall be re-calculated.

An RSs shall transmit received frame to subordinates according to the control message of the multi-frame.

(4) Use of identical frame control information
- use frame control information containing Preamble, FCH and MAPs (or including DCD and UCD)
- apply identical frame control information to all of the frames in a Multi-frame except for the frame number.
- an RS shall update the frame number of received frame control information by incrementing and reassembling for relaying.
- no collision occurs at frame control information even if MR-BS and RSs transmit different frames at the same time.
- RS ignores the burst which is not related to the RS’s subordinates.
(5) An example of Hop Channel (HC) Assignment

(fig. 2) Burst transmission and reception state diagram at nodes for the sample topology

(fig. 3) An example of hop channels assignment
(6) Link Flows for the Sample topology

(fig. 4) Link Flows for the Sample topology
3.2. Operation flow of a Multi-frame in MR-BS

- **Start**
- Decide the length of MF using topology and load
- Assign a DL RS-CMD channel & UL RS-RPT channels if needed
- Assign DL/UL Hop channel, DL/UL Management Channels if needed
- Build RS-CMD message including:
  1. SF start frame number
  2. SF end frame number
- Create common frame control information (FCH, MAP) applicable to all frames in the multi-frame
- Transmit/receive the frame and its contents
- **End**
<Operation flow of frame relaying for the subsequent frame>

- **wait for a new frame control information**
  - **No**
  - **CRC ok?**
    - **Yes**: change the frame number to the next number, reassemble new frame control information
    - **No**: check the frame control information transmission condition for the next frame time
  - **Yes**: transmit the frame control information in frame synch. to the MMR-BS

<Operation flow of DL burst relaying for the subsequent frame time at RS>

- **wait for decision of frame control information transmission**
  - **No**: exist DL bursts of own subordinates?
    - **Yes**: transmit received bursts timely
  - **Yes**: transmit received bursts timely
<Operation flow of UL burst relaying for the subsequent frame time at RS>

- Wait for a frame control information from the superordinate
  - No
  - Yes
  - Exist UL burst from own subordinate?
  - Prepare the UL data and control bursts
  - Transmit UL bursts in the UL burst channels timely

<Operation flow of UL Ranging information relay at RS>

- Wait for UL ranging and control info. from MSs
  - Reformat and update the received info.
  - Exist UL RS report channel?
  - Send the info. using the RS report channel

4. Advantages
O Enhanced hopping capacity using dynamic scalability of Multi-frame size.
O Alleviation of mutual interference between MR-BS and RS, or between RSs because of using identical frame control information

5. Related ToC

8.4.4.7 Frame structure of MR-BS and RS
6.3.2.3 MAC management message
6.3.6.7.2 Centralized scheduling
6.3.26 Relay Operation for Multi-frame Mode (append this section)

6. Text Proposal

+++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

Insert new subclause 8.4.4.7.3

8.4.4.7.3 Multi-frame structure for consistency with 802.16e legacy mode

In this approach, MR-BS and RS use the legacy 802.16e frame structure as a unit frame to construct a multi-frame by grouping these units with a repeating pattern according to the hop number.

Insert new subclause 8.4.4.7.3.1

8.4.4.7.3.1 MR-BS frame structure

For the TDD mode, each MR-BS frame begins with a preamble followed by an FCH and the DL MAP and possibly UL MAP which is the same of those described in Section 8.4.4.2. The number of frames that make up a multi-frame shall be configurable at MR-BS. The MR-BS frame structure shall be referred to Figure 218 of Section 8.4.4.2.

Insert new subclause 8.4.4.7.3.2

8.4.4.7.3.2 Relay frame structure

For the TDD mode, Relay alternates between Relay-mode and MS-mode. During Relay-mode, each RS generates a frame which begins with a preamble followed by an FCH and the DL MAP and possibly UL MAP which is the same of those described in Section 8.4.4.2. During MS-mode, each RS functions as a legacy MS frame operation.

Append following two rows into Table 14 of 6.3.2.3:

<table>
<thead>
<tr>
<th>Type</th>
<th>Message name</th>
<th>Message description</th>
<th>Connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>??70</td>
<td>RLY-CMD</td>
<td>Relay Request</td>
<td>Basic</td>
</tr>
<tr>
<td>??71</td>
<td>RLY-RPT</td>
<td>Relay Report</td>
<td>Basic</td>
</tr>
</tbody>
</table>

Append following text into subsection of 6.3.2.3
In order to control RS’s correct operation, MR-BS shall transmit the same RLY-CMD messages to the relay group for every frame of the corresponding Multi-frame.

An MR-BS generates RLY-CMDs including all of the following parameters, as shown in Table xx:

- **Start frame number**
  Start frame number of current Multi-frame. The value is the least significant 8 bits of the start frame

- **End frame number**
  End frame number of current Multi-frame. The value is the least significant 8 bits of the end frame

- **Command Body**
  This parameter is reserved for future use of higher layer. This may contain routing information for specific RS or RS’s operation due to MS’s association.

---

Append following text into subsection of 6.3.2.3

### 6.3.2.3.??71 Relay report message

An RS shall transmit a RLY-RPT message using UL burst allocated to the RS. An RS shall generate RLY-RPT message including parameters shown in Table yy.
Report Body
These parameter is reserved for future use. It may contain the ranging information from MSs and/or from neighbors.

6.3.6.7.2 Centralized scheduling

Append following sentences in section 6.3.6.7.2

(1) Multi-frame Mode (optional)
A Multi-frame (MF) is comprised of a set of subsequent frames generated according to network topology and traffic load.
Before making up next Multi-frame, an MR-BS should determine the length of next Multi-frame and prepare contents of hop channels of each frame with reference to the routing topology and traffic load. The routing topology will be maintained by path management described in 6.3.25. The Multi-frame mode is based on relaying principle of frame unit. So the length of Multi-frame should guarantee delivery of burst from/to the designated MS.

The Length of Multi-frame ($LMF$) may be calculated as follows:

$$LMF = \max \{MHR+1, 2*MHM - 1\}$$

where,

- $MHR = $ the maximum hop distance of connected RSs within the MR network
- $MHM = $ the maximum hop distance of MSs which have at least one UL burst to be supposed to be served by MR-BS at the start of MF

A hop channel is a collection of bursts located in the same time position within a Multi-frame for a relay path. Each burst of the channel has the same MCS every frame of the Multi-frame, so that the MAP messages shall be the same in every frame, excluding frame number.
Create following section

6.3.26 Relay Operation for Multi-frame Mode (optional)

6.3.26.1 Frame relaying for the subsequent frame at RS

(This section is applied only when RLY-CMD is received successfully.)
After successful reception of the frame control information including the messages, the RS shall reconstruct the frame with the frame number increased by 1. With the synchronization of the subsequent frame, the RS shall transmit the reconstructed frame if the following conditions are met:

C1: the value of modulo $2^8$ of revised frame number is within the Start frame number and End frame number parameter in the RLY-CMD message

C2: No UL burst transmission is expected in the subsequent frame period.

RS shall reconstruct the frame according to the procedures of following subsection 6.3.26.2, 6.3.26.3 for DL/UL bursts.
6.3.??26.2 DL/UL burst relaying for the subsequent frame at RS

DL burst relaying is performed only when all the conditions C1,C2 in 6.3.??26.1 are satisfied and the bursts to be relayed are related to the RS’s subordinate MSs or RSs. UL burst relaying should be performed in the subsequent frame whenever new UL burst was received in current frame.

6.3.??26.3 Relay operation for UL Ranging information at RS

(This section is applied only when RLY-RPT message channel is received successfully.) Whenever ranging information is received from MSs, RS should collect each information and insert into incoming RLY-RPT message channel.

Figure xxx---Frame relaying flow at RS
