Venue: IEEE 802.16 Session #16

Base Document:

IEEE 802.16abc-01/47

Purpose:

This contribution is presented to the Task Group in Session #16 to update the Single Carrier PHY throughput and channel efficiency clause of the IEEE802.16ab-01/r2 document.

Notice:

This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate text contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

IEEE 802.16 Patent Policy:

The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures (Version 1.0) <<http://ieee802.org/16/ipr/patents/policy.html>>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, if there is technical justification in the opinion of the standards-developing committee and provided the IEEE receives assurance from the patent holder that it will license applicants under reasonable terms and conditions for the purpose of implementing the standard."

Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <<mailto:r.b.marks@ieee.org>> as early as possible, in written or electronic form, of any patents (granted or under application) that may cover technology that is under consideration by or has been approved by IEEE 802.16. The Chair will disclose this notification via the IEEE 802.16 web site <<http://ieee802.org/16/ipr/patents/notices>>.

Contribution

- Incorporate provided text as revision of Section 8.3.4.15 of document 80216ab-01_01r2.
- This contribution completely simplifies and merges two subsections into one with more accurate results.

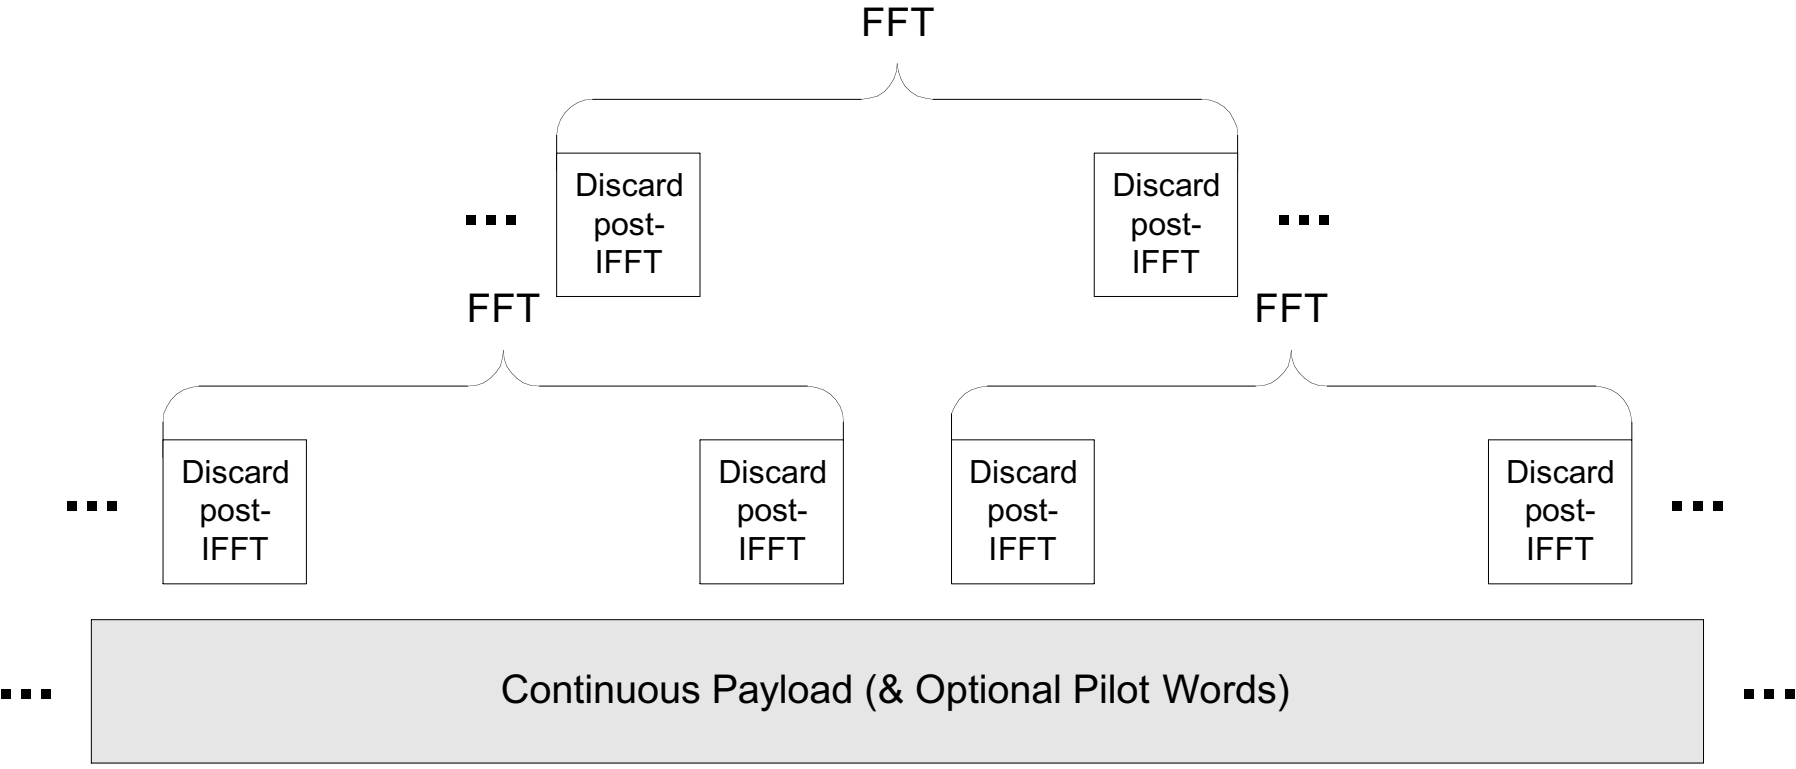

Continuous transmission Format:

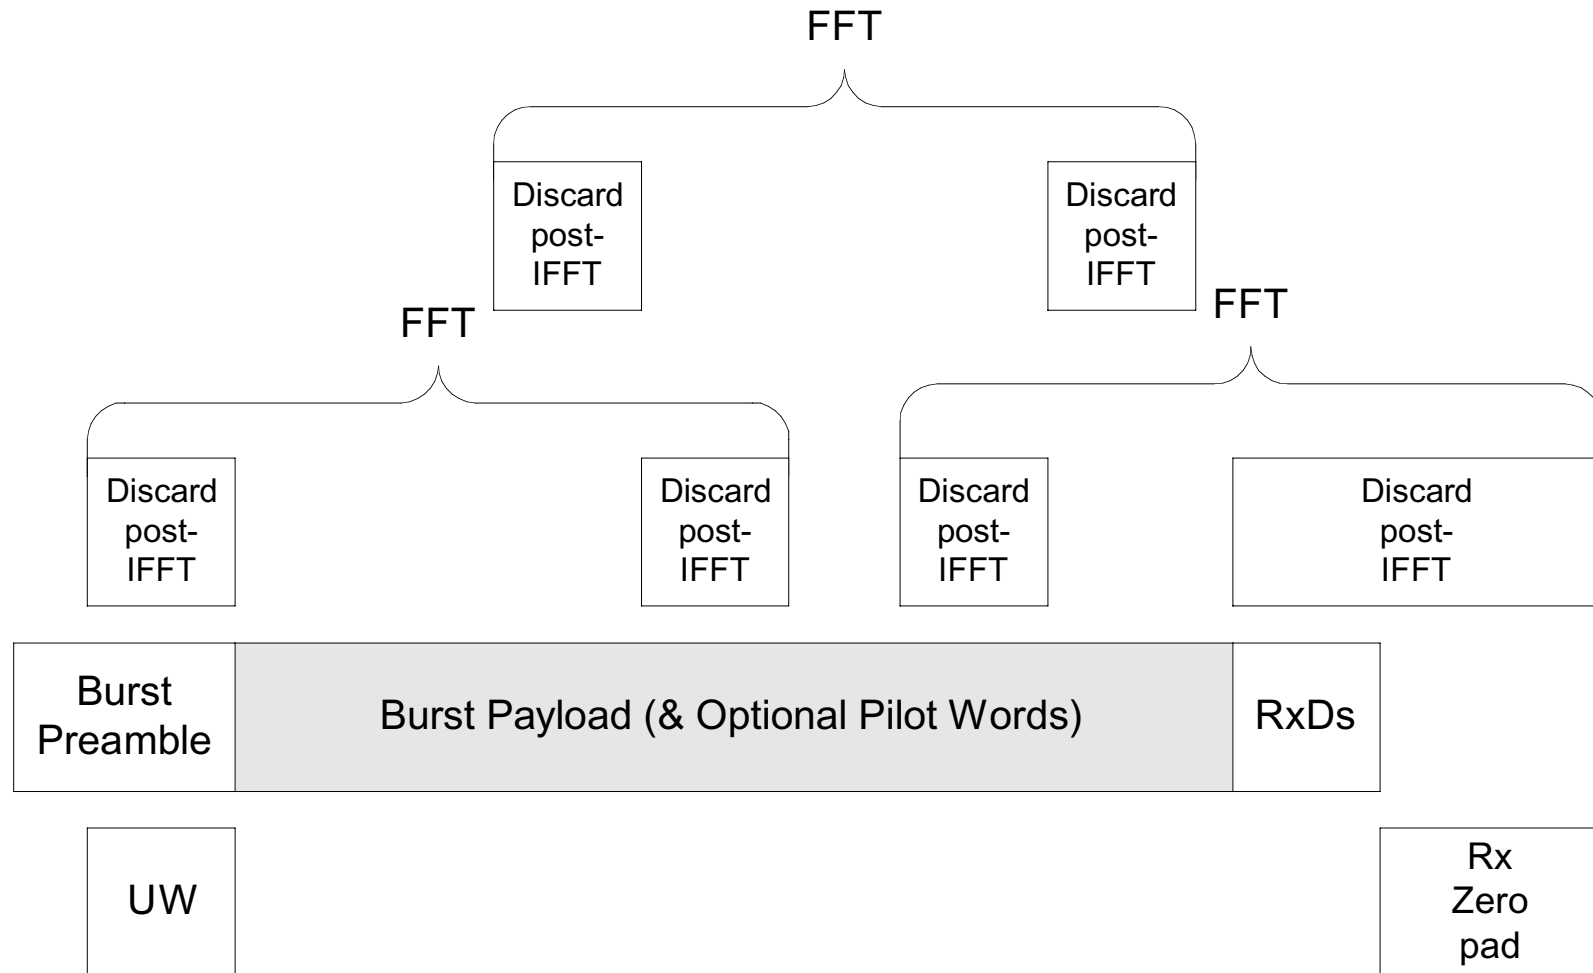

Burst transmissions Frame Format

Overlap Save Scheme of Arbitrary Continuous Payload

Overlap Save Scheme of Arbitrary Bursty Payload

Parameters and Values Defining Operating Modes for SC Systems

Selection Level	Parameter	Symbol	Set of Values
System-Dependent Parameters	Channel BandWidth (MHz)	W	1.75, 3.5, 7, 14, 1.5, 3, 6, 12
	Design Maximum Delay Spread (μ sec)	d	4, 10, 20
	Spectral Guard Factor	γ	0.18, 0.25
	Symbol Rate (MSymb/sec)	R	$R = (1 + \gamma)W$
Link-Dependent Parameters	<small>Number of QAM</small> Constellation States	<small>M</small>	<small>4, 16, 64</small>
	<small>Convolutional (inner)</small> Code Rate	<small>r_i</small>	1/2, 2/3, 3/4, 7/8
	Reed-Solomon (Outer) Code Rate	<small>r_o</small>	239 / 255 = 0.937
Traffic-Dependent Parameter	Burst Data Payload Size for uplink (in Bytes)	P	239, 717, 1195, 1673
Traffic-Dependent Parameter	Continuous Data Payload Size for downlink (in Bytes)	P	1673, 2151, 2629, 3585

System throughput for the burst transmission modes

$U = R \cdot d$, rounded up to the nearest power of 2.

$$T_{burst} = \frac{8PR \log_2(M)}{\left(\frac{8P}{r_I r_O} + (A + U) \log_2(M) \right)}$$

System throughput for the continuous transmission modes

$$T_{cont} = \frac{8PR \log_2(M)}{\left(\frac{8P}{r_I r_O} + A \log_2(M) \right)}$$

P is the burst data size and A is used as the average frame preamble size (in symbols).

The choice of $A=2U$ for the uplink and the choice of $A=4U$ for the downlink.

SC Channel Efficiency

$$E_{burst} = T_{burst} / W = \frac{T_{burst}}{(1 + \gamma)R} = \frac{8P \log_2(M)}{(1 + \gamma) \left(\frac{8P}{r_I r_O} + (A + U) \log_2(M) \right)}$$

$$E_{cont} = T_{cont} / W = \frac{T_{cont}}{(1 + \gamma)R} = \frac{8P \log_2(M)}{(1 + \gamma) \left(\frac{8P}{r_I r_O} + A \log_2(M) \right)}$$

Throughput for various Models in 1.75 MHz Channels (Uplink Burst)

System Throughput for Overlap Save Technique									
(for Single Carrier Burst Mode U/L with W = 1.75 MHz bandwidth)									
System-Dependent Parameters		Link-Dependent Parameters		System Throughput (in Mbits/sec)				System Efficiency	
Symbol [Sample]	Design Max Delay Spread (U in Symbols)	Number of QAM States	Convolutional Code Rate	Packet Size (P in Bytes)				(in Mbits/sec/Hz)	
Rate (MS/sec)				239	717	1195	1673	(P= 1673)	
	8	4	1/2	1.37	1.38	1.39	1.39	0.79
