The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16. |
| Patent Policy and Procedures | The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures http://ieee802.org/16/ipr/patents/policy.html , including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair mailto:chair@wirelessman.org as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site http://ieee802.org/16/ipr/patents/notices . |

Applying scalability for the OFDMA PHY layer

Yossi Segal Yigal Leiba Itzik Kitroser Zion Hadad Runcom

1 Introduction

The OFDMA PHY defined in the 802.16d uses a 2K FFT for its operation. This configuration shows good performance for channels using high bandwidth allocation (as will be shown in the document). In order to extend its performance for lower bandwidth channels it is recommended to apply some scalability to the 802.16d OFDMA PHY. This document shall elaborate on a simple and effective way to make these changes.

2 Evaluation of performance

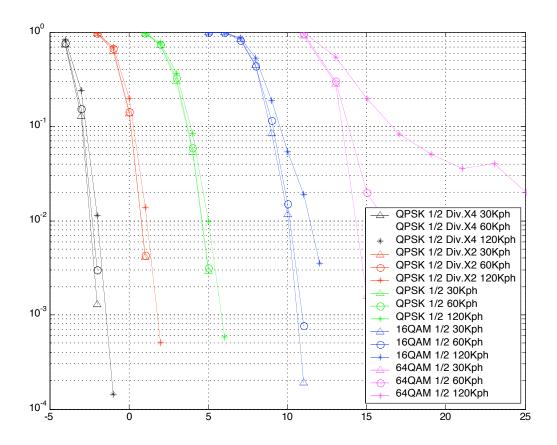

The current PHY performance was evaluated in former documents:

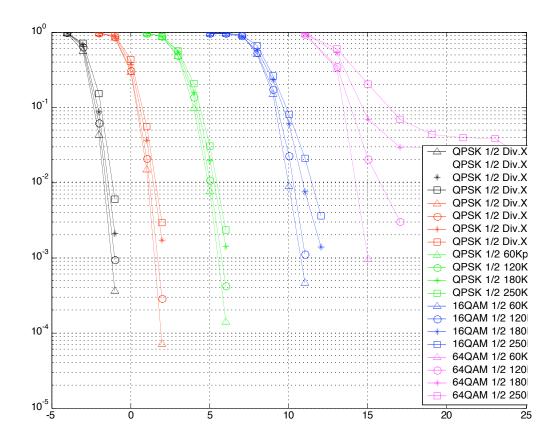

- IEEE C802.16d-03/78r1 Coverage/Capacity simulations for OFDMA PHY in with ITU-T channel model
- IEEE C802.16e-04/16 Coverage/Capacity simulations for OFDMA PHY in ITU-T channel model including MRC, STC, AAS results

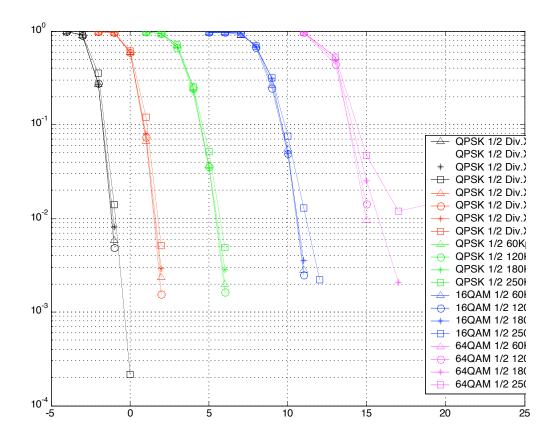

The performance of the PHY layer has shown very good performance even for high mobility (especially for high channel bandwidth >= 5MHz). Some of the results are reproduced hereafter for convenience and for further analysis; the simulation environment included the following:

- DL PUSC/FUSC models of the IEEE802.16d OFDMA PHY
- Real channel estimation process
- Block sizes of 384-576bits (depending on modulation)
- Covolutional Turbo Code scheme using code rate _
- Phase noise model with a power of -85dBc/Hz flat up to 10KHz and then reducing 20dB/dec up to -120
- ITU-B model for vehicular speeds

The following graphs presents the performance of the PHY for 2.5,5,10MHZ channel bandwidth (title of the graph describes the scenario, legend describes the different modulations and speeds tested).

The performance for 10MHz channel BW shows clearly that the PHY supports speeds of up to 250Kmph even for 16QAM and 180Kph for 64QAM with a small degradation. For lower bandwidth the maximum speed declines but the 2K mode can support very high mobility with lower modulations (where for higher modulations some degradation is noticeable).

Taking the performance of the PHY into consideration and the IEEE802.16d definition to support bandwidths starting from 1.25MHz, it is evident that for the IEEE802.16e some additions to standard are appropriate to support very high mobility better for low channel bandwidth allocations.

3 Suggested modifications (Scalability)

A possible solution to the requirements of the IEEE802.16e and the actual OFDMA PHY defined for IEEE802.16d is to use smaller FFT sizes in order to compensate on the large symbol times for lower bandwidths enforced by the 2K FFT. The solution can include adding a configuration of the current OFDMA PHY to be used with 1K or/and 512 FFT size.

Scaling the performance of the 2K mode in the graphs shown before it could be deducted that the performance of the 2K mode FFT for 10MHz will be reproduced by a 512 FFT sizes for 2.5MHz (and so on).

These new definitions for 1K/512 FFT size could be easily incorporated as optional elements of the OFDMA PHY by changing some basic parameters. The major thing to be changed is the definition of the symbol structure for these FFT sizes (duplicating table 247 and 247a – new addition).

4 Specific text changes

[Add the following text at the end of section 8.4.1]

The mandatory OFDMA PHY mode that shall be supported by all SS is based on a 2048-FFT. Other FFT sizes may optionally be employed as well. These FFT sizes are scalable to the channel BW in which they are being used, i.e., 512-FFT for 5 MHz channel BW or less and 1024-FFT for 10 MHz channel BW or less. Any configuration shall use the 2048-FFT for at least one frame duration every one second.

[Add the following text in section 8.4.6.1.1 just before table 246]
For FFT size other than 2048-FFT, only the first k elements of table 246 shall be used to modulate the DL preamble sub-carriers, where k is the number of carries

[Add the following table in section 8.4.6.1.2]

5 Conclusion

The performance of the IEEE802.16d OFDMA PHY layer has been presented, the performance achieved for high bandwidth are very good and deteriorated for lower bandwidth.

A simple and straight forward way has been shown to add a 1K and 512 FFT sizes to the OFDMA PHY layer to cope with high mobility demands when low channel bandwidth are allocated.

It is recommended that the IEEE802.16e WG will consider these changes to be added to the current draft.
