| Re:                          | Call for contributions regarding P802.16m project, 1/22/2007  |  |
| Abstract                     | This document contains proposed simulation evaluation methodology for IEEE 802.16m standard.  |  |
| Purpose                      | For discussion and approval by TGm  |  |
| Notice                       | This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.  |  |
| Release                      | The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.  |  |
| Patent Policy and Procedures | The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures < <a href="http://ieee802.org/16/ipr/patents/policy.html">http://ieee802.org/16/ipr/patents/policy.html</a> >, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair < <a href="mailto:chair@wirelessman.org">mailto:chair@wirelessman.org</a> > as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site < <a href="http://ieee802.org/16/ipr/patents/notices">http://ieee802.org/16/ipr/patents/notices</a> >. |  |

## SIMULATION EVALUATION METHODOLOGY

### 1.1 LINK-LEVEL SIMULATION

The link level issues that need to be addressed in order to achieve alignment are given in the following Table. Simulation results should indicate the link to system level mapping methodology used.

Table A.1.1-1 – Link Level issues

| Issues                       | Details                        |
|------------------------------|--------------------------------|
| DL Modulation                | QPSK, 16QAM, 64QAM, ...        |
| UL Modulation                | QPSK, 16QAM, 64QAM, ...        |
| DL Coding                    | Turbo, LDPC, ...               |
| UL Coding                    | Turbo, LDPC, ...               |
| Non-ideal receiver functions | Channel estimation,            |
| Available Mappings           | Account for HARQ, IR, and MIMO |
| Synchronization Error        | Perfect                        |
| SNR Mapping                  | EESM, MIC, ...                 |

### 1.2 SYSTEM-LEVEL SIMULATION

#### 1.2.1 General Assumptions

Table A.1.2.1-1 – Macro-cell system simulation parameters

| Parameter   | Assumption  |     |
|---|---|-----|
| Cellular Layout   | Hexagonal grid, 19 cell sites, 3 sectors per site   |     |
| Frequency reuse   | 1:1, 1:3  |     |
| Inter-site distance   | 3km, 10km, 50km, ...  |     |
| Distance-dependent path loss  | SS : SUI<br>MS : COST-231 HATA, urban   |     |
| Shadowing standard deviation  | 8 dB  |     |
| Correlation distance of Shadowing   | 50 m  |     |
| Shadowing correlation   | Between cells   | 0.5 |
|   | Between sectors   | 1.0 |
| Penetration Loss  | 10dB, 20dB, ...   |     |
| Antenna pattern [4] (horizontal)<br>(For 3-sector cell sites with fixed antenna patterns) | $A_{3dB} = \min \left( 12 \frac{A_m}{3dB}, A_m \right)$<br>$A_m = 20$ dB<br>$A_{3dB} = 70$ degrees, $A_m = 20$ dB |     |
| Carrier Frequency / Bandwidth   | 5MHz, 10MHz, 20MHz, ...   |     |
| Channel model   | Non-MIMO : Typical Urban (TU)<br>MIMO : Spatial Channel Model (SCM)   |     |
| UE speeds of interest   | 3km/h, 30km/h, 120km/h, 350km/h   |     |
| Total BS TX power (Ptotal)  | 43dBm   |     |

|   |  |
|---|--|
| UE power class  | 23dBm (200mw)  |
| Antenna Bore-sight points toward flat side of cell (for 3-sector sites with fixed antenna patterns) |  |
| Users dropped uniformly in entire cell  |  |
| Minimum distance between UE and cell  | $\geq 35$ meters   |

## 1.2.2 Channel Models

### 1.2.2.1 ITU channel model

The ITU channel model could be used as the channel model for the Non-MIMO system.

**Table A.1.2.2-1 – System simulation channel Model (ITU)**

| ITU Model     | Number of Multipaths | Speed(km/h)           | Assignment Prob |
|---------------|----------------------|-----------------------|-----------------|
| Line of Sight | 1                    | 0, $f_d=1.5\text{Hz}$ | 0.1             |
| PB            | 6                    | 3                     | 0.3             |
| VA            | 6                    | 30                    | 0.3             |
| VA            | 6                    | 60                    | 0.2             |
| VA            | 6                    | 120                   | 0.1             |

### 1.2.2.2 SCM

The Spatial Channel Model (SCM) accounts for transmitter and receive antenna correlation and more accurately reflects the likelihood of formulating multiple streams (spatial sub-channels) for certain MIMO schemes. The SCM is also needed for Beamforming.

The SCM model should be used to accurately evaluate the MIMO performance.

## 1.2.3 Traffic Models

The following traffic models should be considered :

- FTP
- HTTP
- VoIP
- Video Conferencing
- Streaming
- Gaming
- PTT
- MBS
- IM
- ...

## 1.2.4 System Performance Metrics

The metrics to evaluate the system performance could be the following :

- Sector Throughput
- Cell Edge User Throughput
  - The 5% point of the cumulative distribution function (CDF) of the user throughput a given configuration, and a given fairness and delay criterion in a fully loaded network with full-buffer traffic.
- Aggregate User Throughput
  - The total sustained throughput (uplink + downlink), net of MAC & PHY layer overheads, across all users scheduled on the same RF channel
  - spectral efficiency
    - Aggregate User Throughput in Mbps (defined above) / Channel Bandwidth (MHz)
- System Outage
- User latency distribute
- User jitter distribute
- VoIP user Capacity
  - The supported voip user number for a given outage in a fully loaded network
- Control channel reliability
  - The 5% point of the cumulative distribution function (CDF) of the control channel SNR for given network configuration parameters.

## 1.3 MAC LAYER MODELLING

### 1.3.1 Overhead

The MAC PDU overhead and control message overhead should be modeled to evaluate the affect to the sector and user throughput.

### 1.3.2 Scheduling

Various scheduling approaches will have performance and overhead impacts and will need to be aligned.

System performance evaluation and comparison require that fairness be preserved or at least known in order to promote comparisons. Fairness is defined as the normalized user packet call throughput CDF.

### 1.3.3 Feedback

The various feedback delay and error should be modeled to evaluate the affect to system performance.

## 1.4 PHY LAYER MODELLING

### 1.4.1 PHY abstraction

TBD

### 1.4.2 Interference model

TBD
