Re: IEEE 802.16m-08/033 – Call for Contributions and Comments on Project 802.16m System Description Document (SDD), on the topic of “MAC: Data Plane”

Purpose: Adopt the proposal into the IEEE 802.16m System Description Document

Notice:

This document does not represent the agreed views of the IEEE 802.16 Working Group or any of its subgroups. It represents only the views of the participants listed in the “Source(s)” field above. It is offered as a basis for discussion. It is not binding on the contributor(s), who reserve(s) the right to add, amend or withdraw material contained herein.

Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

Patent Policy:

The contributor is familiar with the IEEE-SA Patent Policy and Procedures:

<http://standards.ieee.org/guides/bylaws/sect6-7.html#6> and <http://standards.ieee.org/guides/opman/sect6.html#6.3>.

Introduction

- This contribution proposes ARQ protocol that address the following TGm SRD (IEEE 802.16m-07/002r4) requirements:
 - User plane latency
 - System overhead

Issues with Legacy ARQ Protocol

- The legacy ARQ uses ACK-based protocol. As the residual error after HARQ is typically 1% or less, ACK-based protocol incurs unnecessary overhead
- There is no coordination between HARQ and ARQ, ARQ may generate unnecessary retransmission before HARQ complete the error recovery process.

Proposed ARQ Protocol for 16m

- NAK-based protocol should be used, i.e. the receiver sends NAK on un-received ARQ blocks. As the probability of HARQ failure is 1% or lower, the occurrence of NAK transmission is low
- ARQ block construction and sequence numbering same as in the legacy system
- At the receiver, a timer is set for each missing ARQ block. A NAK is sent when the timer expires.

HARQ and ARQ Interaction

- On the transmitter side:
 - The HARQ state machine can indicate to the ARQ state machine when a PHY packet has failed after maximum HARQ retries. The ARQ state machine will generate the corresponding ARQ blocks retransmission
 - Most HARQ failure can be fixed by the above transmitter-initiated retransmission. However, in the case of HARQ NAK-to-ACK error, the transmitter side won't be able to trigger the ARQ retransmission. Note that the probability of HARQ NAK-to-ACK error is typically around 0.1%. Although this is a low probability, it would cause a residual packet error of 0.1% which is still too high for TCP type of application which required packet error rate of $\sim 10e-5$.
- On the receiver side:
 - The receiver side ARQ can be used to safe-guard against the HARQ NAK-to-ACK error
 - The HARQ state machine detects the occurrence of NAK-to-ACK error by the following:
 - For async HARQ, the receiver keeps a timer, if after timeout and no retransmission received, it declares that an NAK-to-ACK error has occurred
 - For sync HARQ, if at the predetermined retransmission time, there is no retransmission, it declares that an NAK-to-ACK error has occurred
 - When the HARQ state machine detects that there is a HARQ failure due to NAK-to-ACK error, it informs the ARQ state machine
 - The ARQ state machine will keep a timer which can start after the HARQ informs of a missing PHY PDU. When timer expires, the ARQ sends a message to the transmitter ARQ to indicate the missing ARQ blocks and last ARQ block received.

Proposed Text for SDD

*[Add the following section and text to page 30,
after line 4]*

10.x ARQ
