Venue:

Levi, Finland

Base Contribution:

IEEE C802.16m-07_299r3 or later revision

Purpose:

For discussion and approval by IEEE 802.16 Working Group (Consideration of integrated relay for IEEE 802.16m systems)

Notice:

This document does not represent the agreed views of the IEEE 802.16 Working Group or any of its subgroups. It represents only the views of the participants listed in the "Source(s)" field above. It is offered as a basis for discussion. It is not binding on the contributor(s), who reserve(s) the right to add, amend or withdraw material contained herein.

Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

Patent Policy:

The contributor is familiar with the IEEE-SA Patent Policy and Procedures:

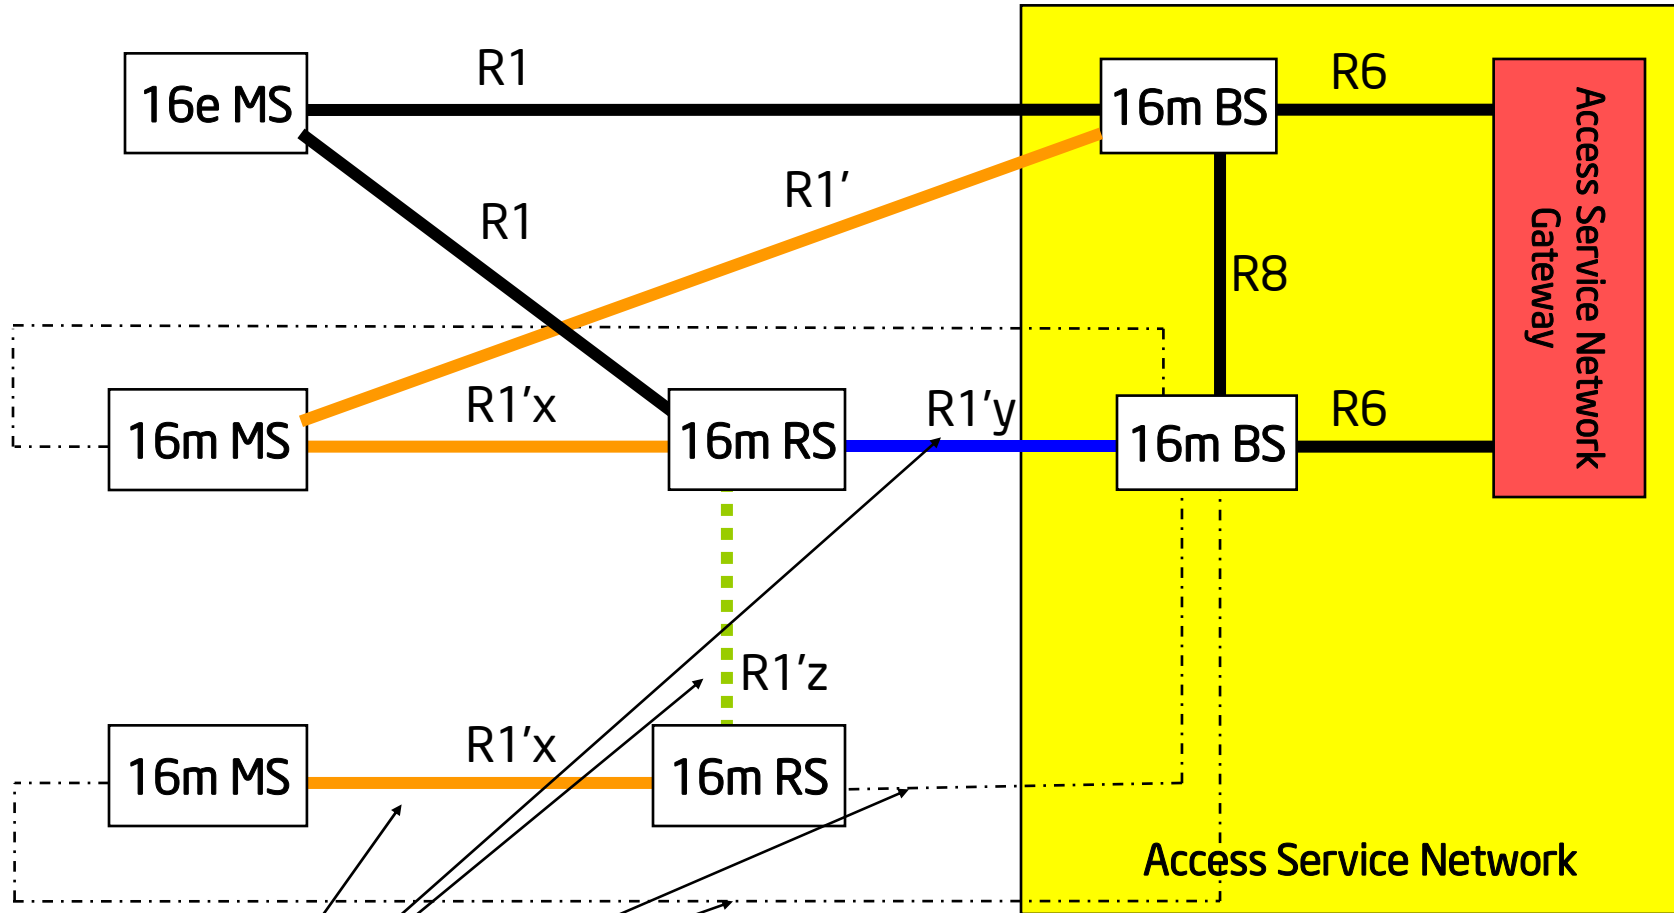

<<http://standards.ieee.org/guides/bylaws/sect6-7.html#6>> and <<http://standards.ieee.org/guides/opman/sect6.html#6.3>>.

Outline

- Network Architecture
- Frequency Usage and Duplexing With Relay
- Relay Functional Architecture
- Classification of Data Plane Functions
- Data and Control Flows for RS nodes

Network Architecture

Layer 1 and Layer 2 protocols to be specified by 802.16m standard

Frequency Usage and Duplexing With Relay

- Support for shared channel (in-band) and dedicated channel (out-of-band relay)
 - Shared channel model - Multiple links share a frequency channel and coordinate the allocation of radio resources
 - Dedicated channel model - Individual links are assigned independent instances of frequency channels and schedulers do not coordinate the allocation of radio resources on the channels
- Duplexing schemes
 - Support both TDD and FDD deployments
 - FDD deployments include FDD and H-FDD MSs
 - Assume that entire network is either TDD or FDD
 - In FDD, all DL transmissions assigned to the DL band and all UL transmissions assigned to the UL band.

Relay Functional Architecture

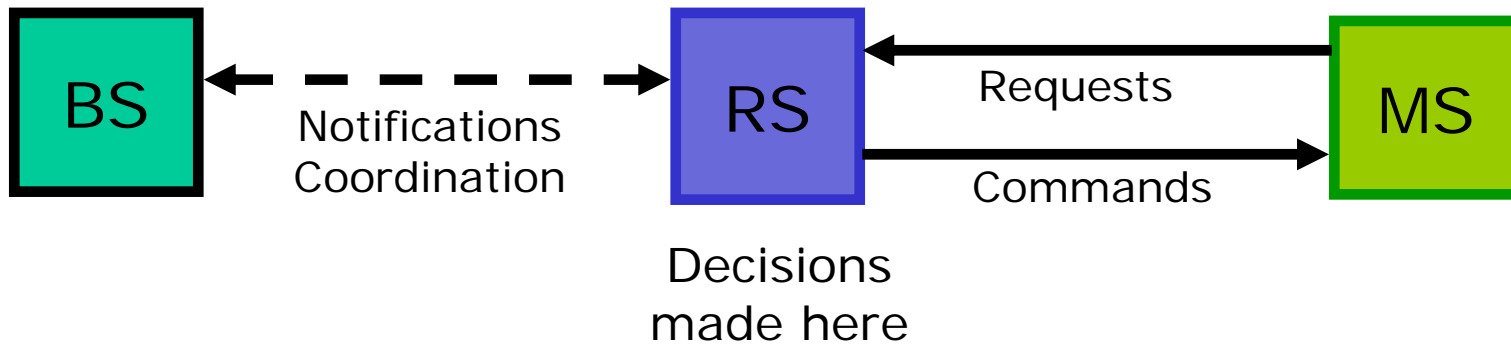

- Integrated relay architecture
 - Extend 802.16j architecture by making MSs aware of the presence of RSs and the multi-hop nature of the path between them and the BS.
 - Some examples of how this is useful are
 - Allows better network entry decisions
 - Support for advanced relay techniques
- Relay support based on common set of relay functions
 - Define common relay functions supported by all RSs and all BSs which support relay operation.
 - More advanced relay functions specified on top of these common features
 - It may be the case that not all RSs implement these advanced functions.
 - This approach promotes commonality between potentially different RS types and discourages the creation of multiple, incompatible RS types.
 - The base relay function set includes a common relay frame structure.
 - Other members of the base relay function set and more advanced relay functions are for further study.

Data Plane Functions Classified as End-to-End and Hop-by-Hop

- Hop-by-hop Functions
 - Performed to transmit/receive data over a single hop in a multi-hop relay network.
 - Performed independently at each hop (coordination across hops is not required)
 - Performed in the same manner at each hop in the network
 - Some examples of such functions are link adaptation and scheduling.
- End-to-end Functions
 - Performed to transmit data across a multi-hop path.
 - Performed in a coordinated manner from source to destination
 - Can be performed differently at different stations along the path.
 - Some examples of such functions are packet forwarding, which is performed at all of the stations along a path, but is different at the source, destination, and intermediate nodes and ARQ, which is performed only at the source and destination.

Control Plane Functions Classified as Centralized or Distributed

Distributed Model

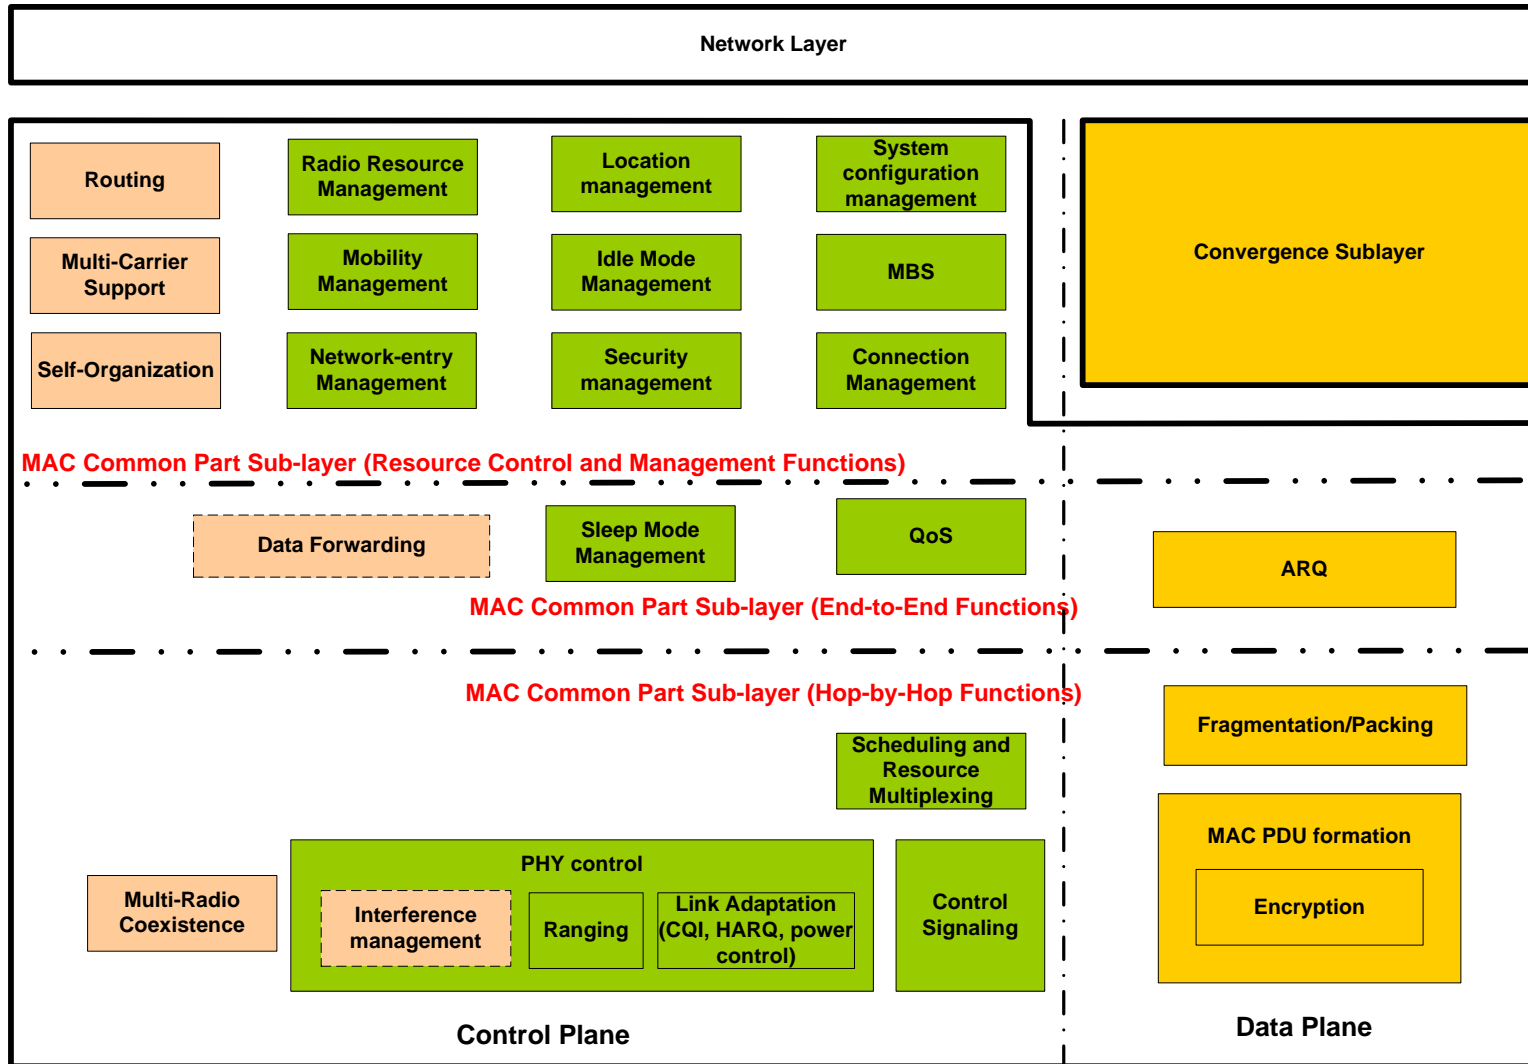

Centralized Model

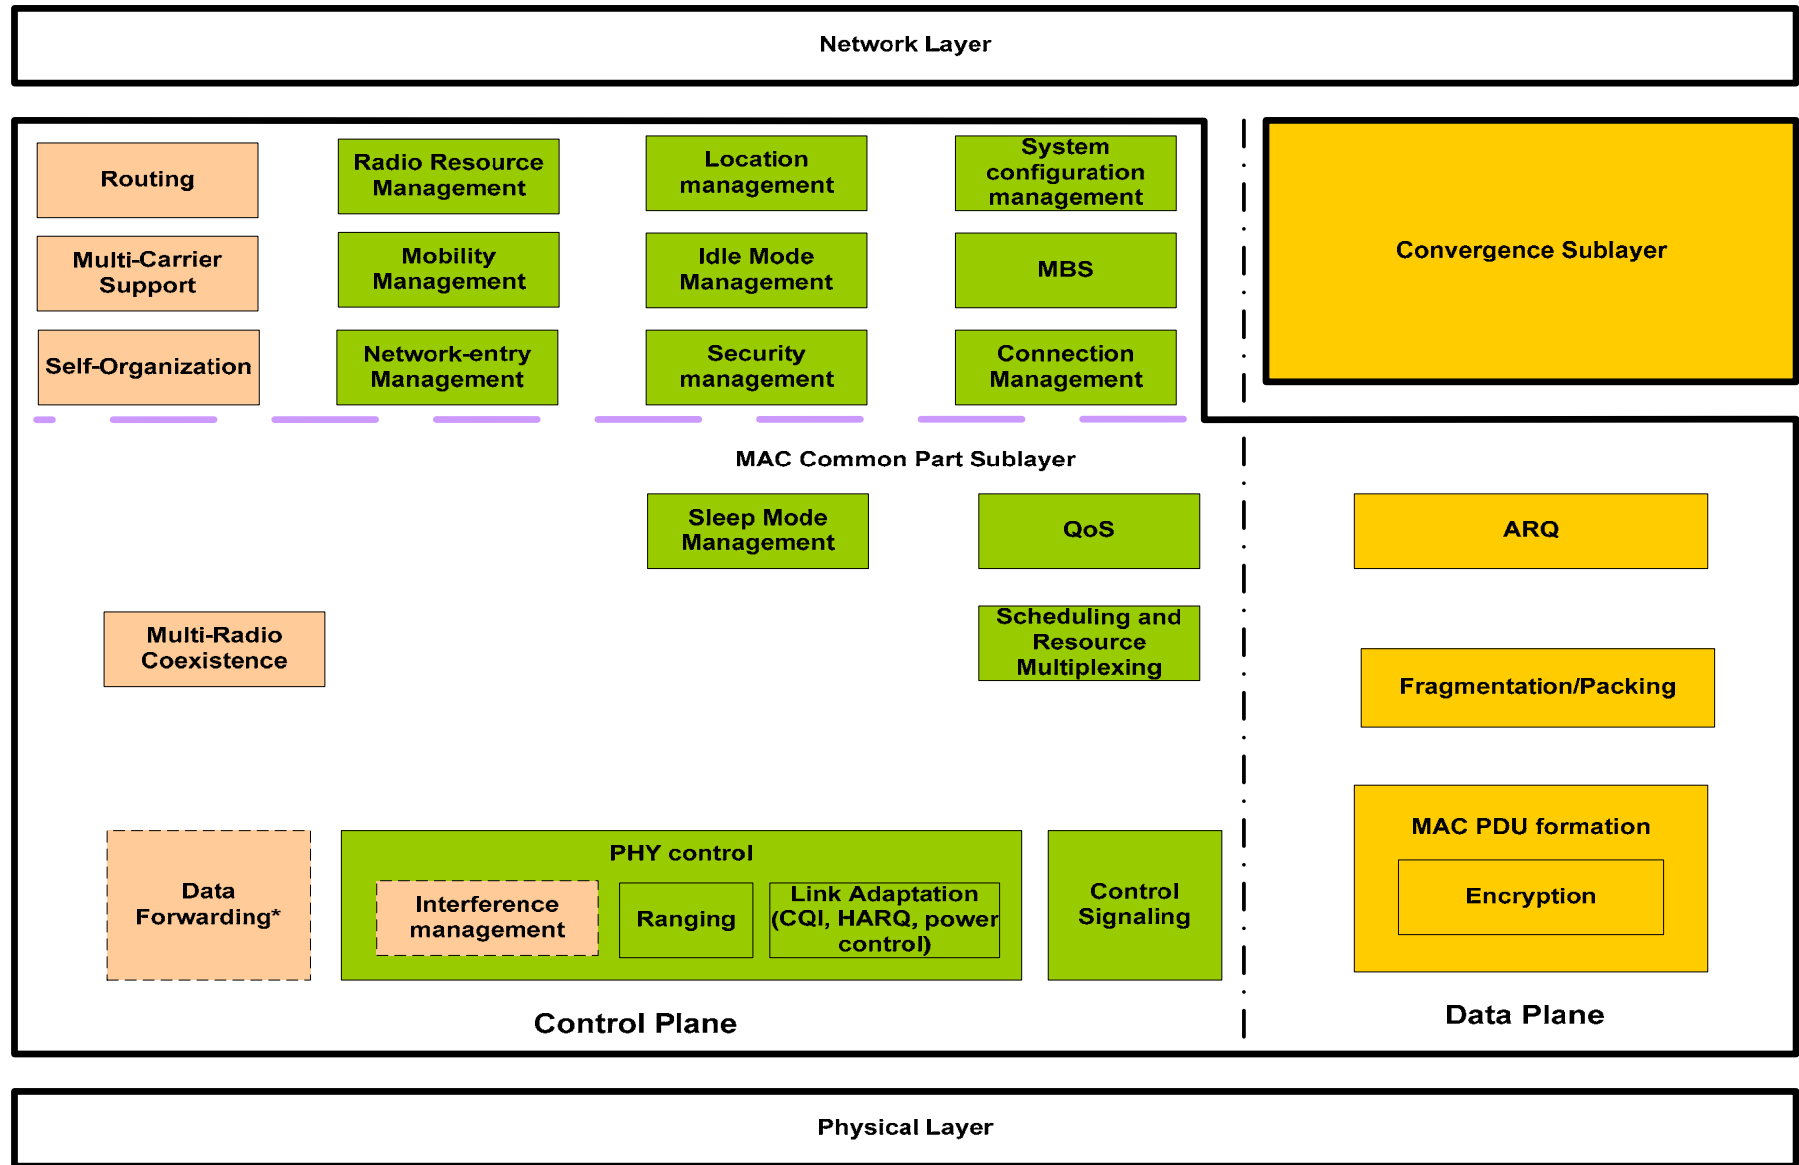

IEEE 802.16m Air-Interface Protocol Stack

Example Classification of Layer 2 Functions Across Data and Control Planes

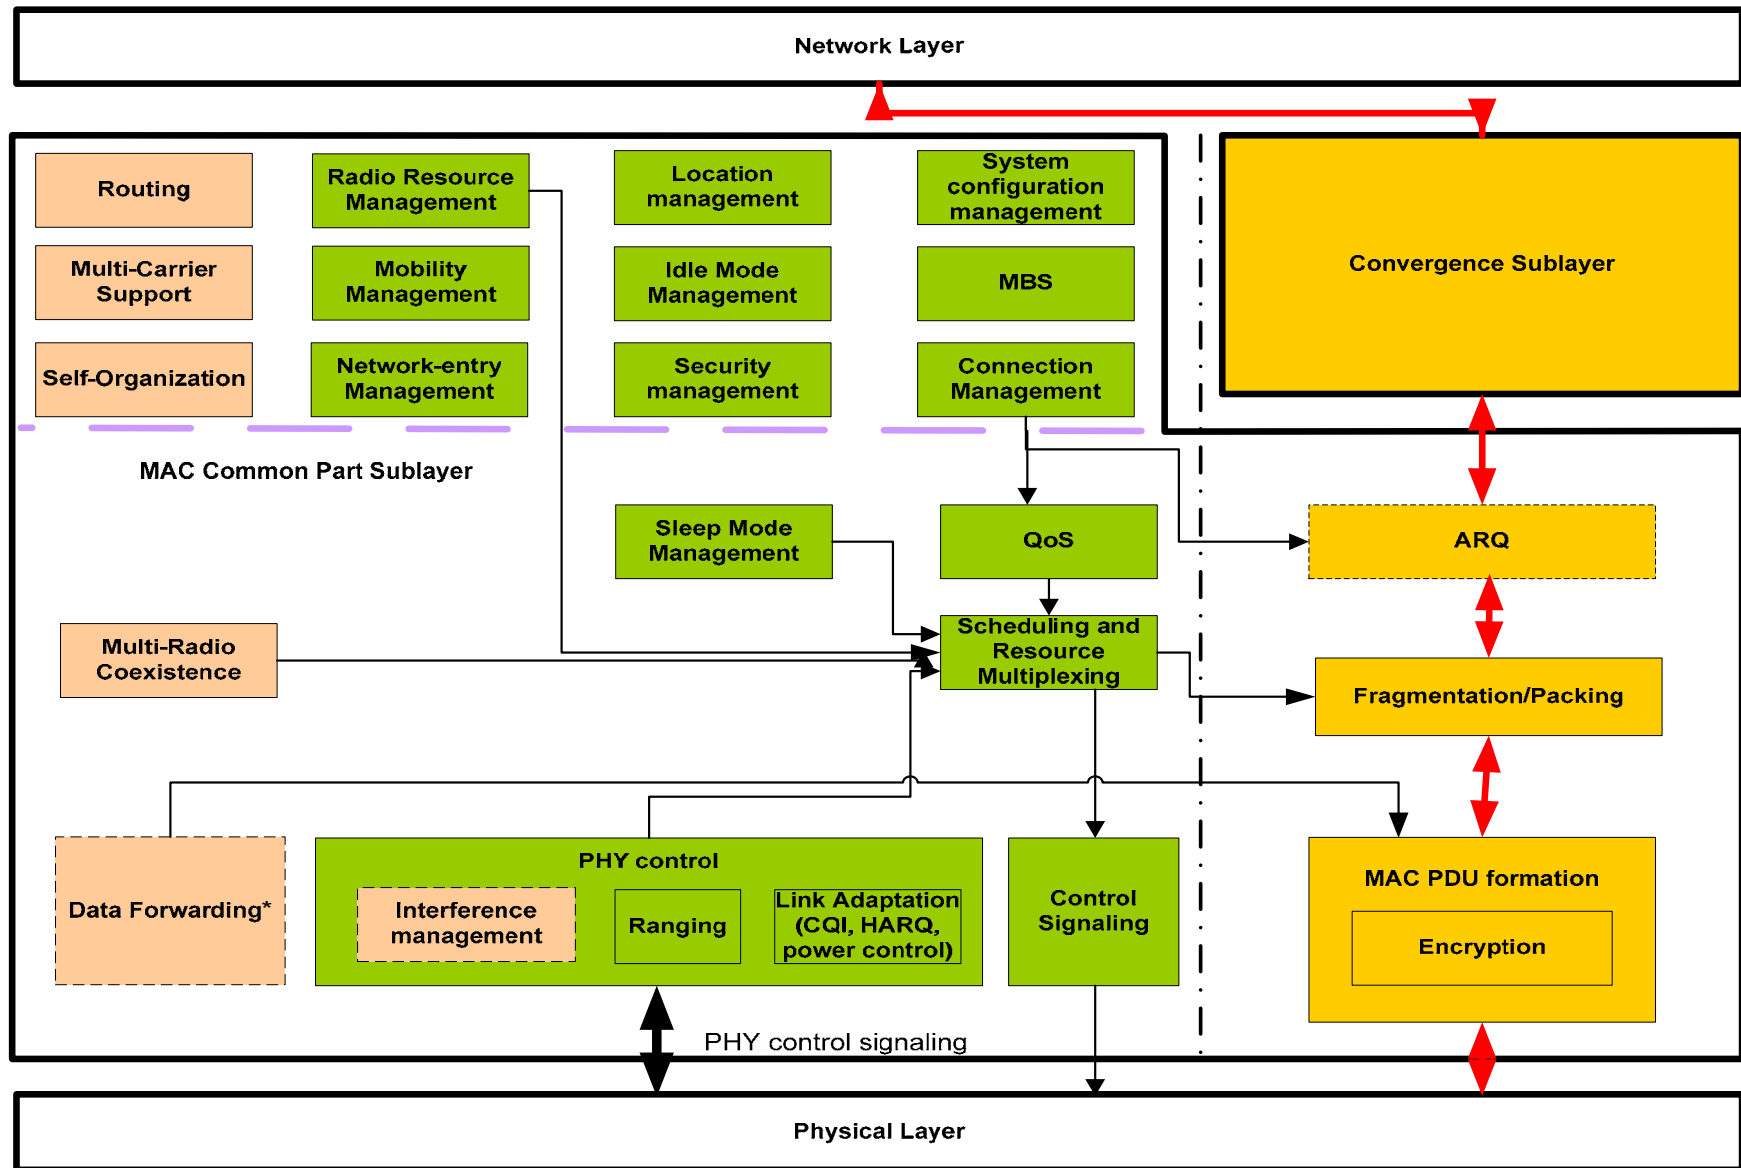

IEEE 802.16m Protocol Functions for End Nodes (BS, MS)

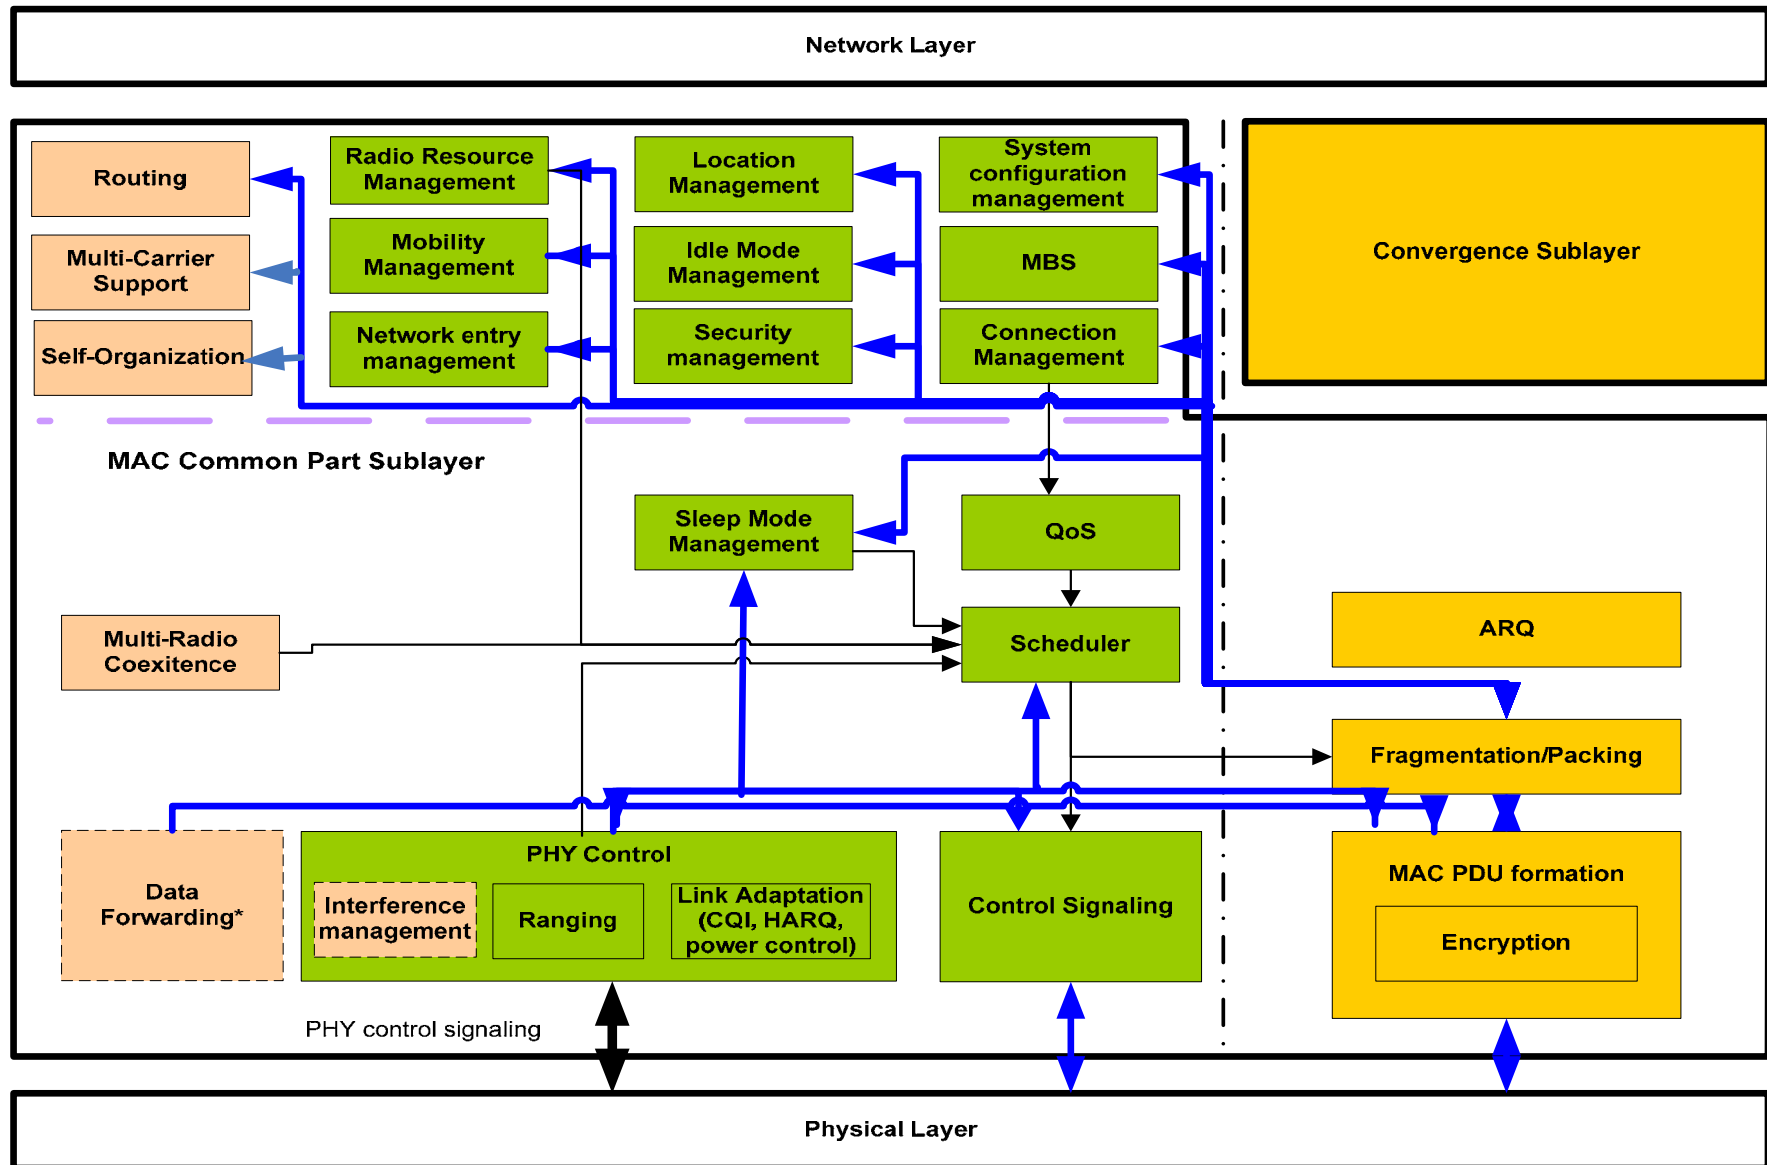

* Note that the Data Forwarding Function applies only to the BS

Data Flow for IEEE 802.16m End Nodes (BS, MS)

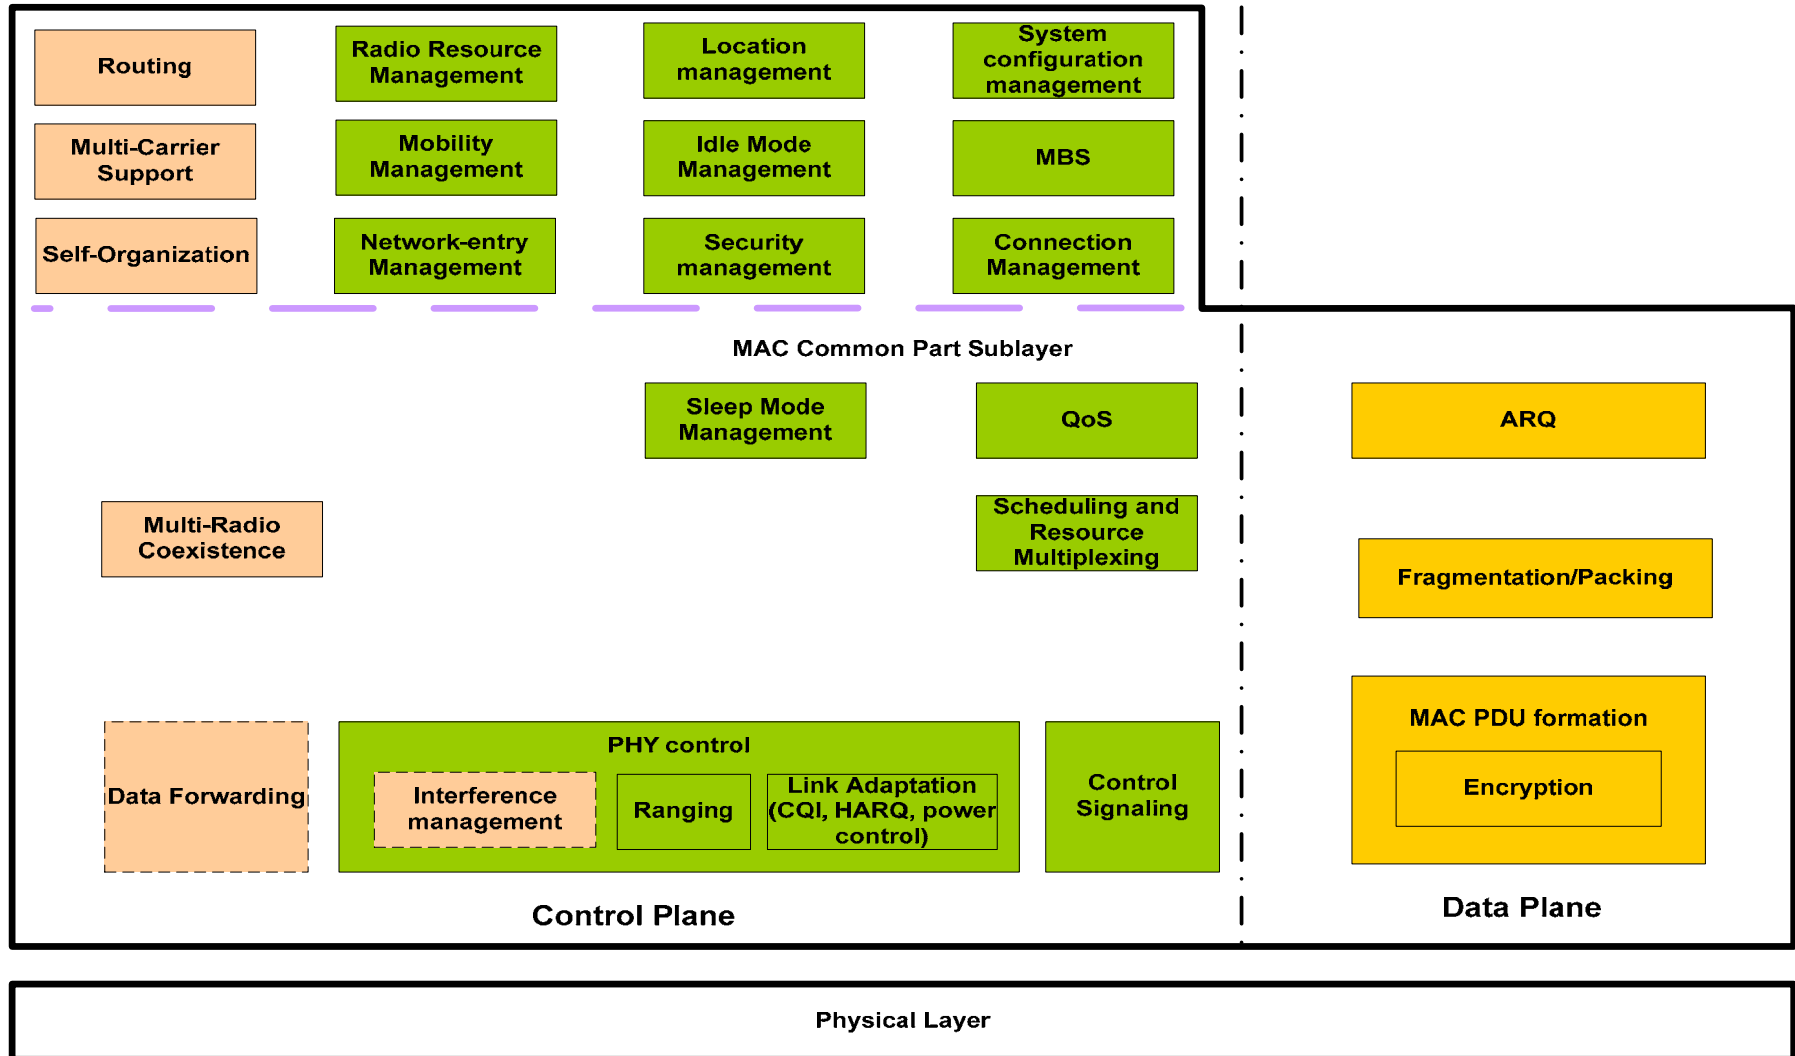

* Note that the Data Forwarding Function applies only to the BS

MAC Signaling Flow for IEEE 802.16m End Nodes (BS, MS)

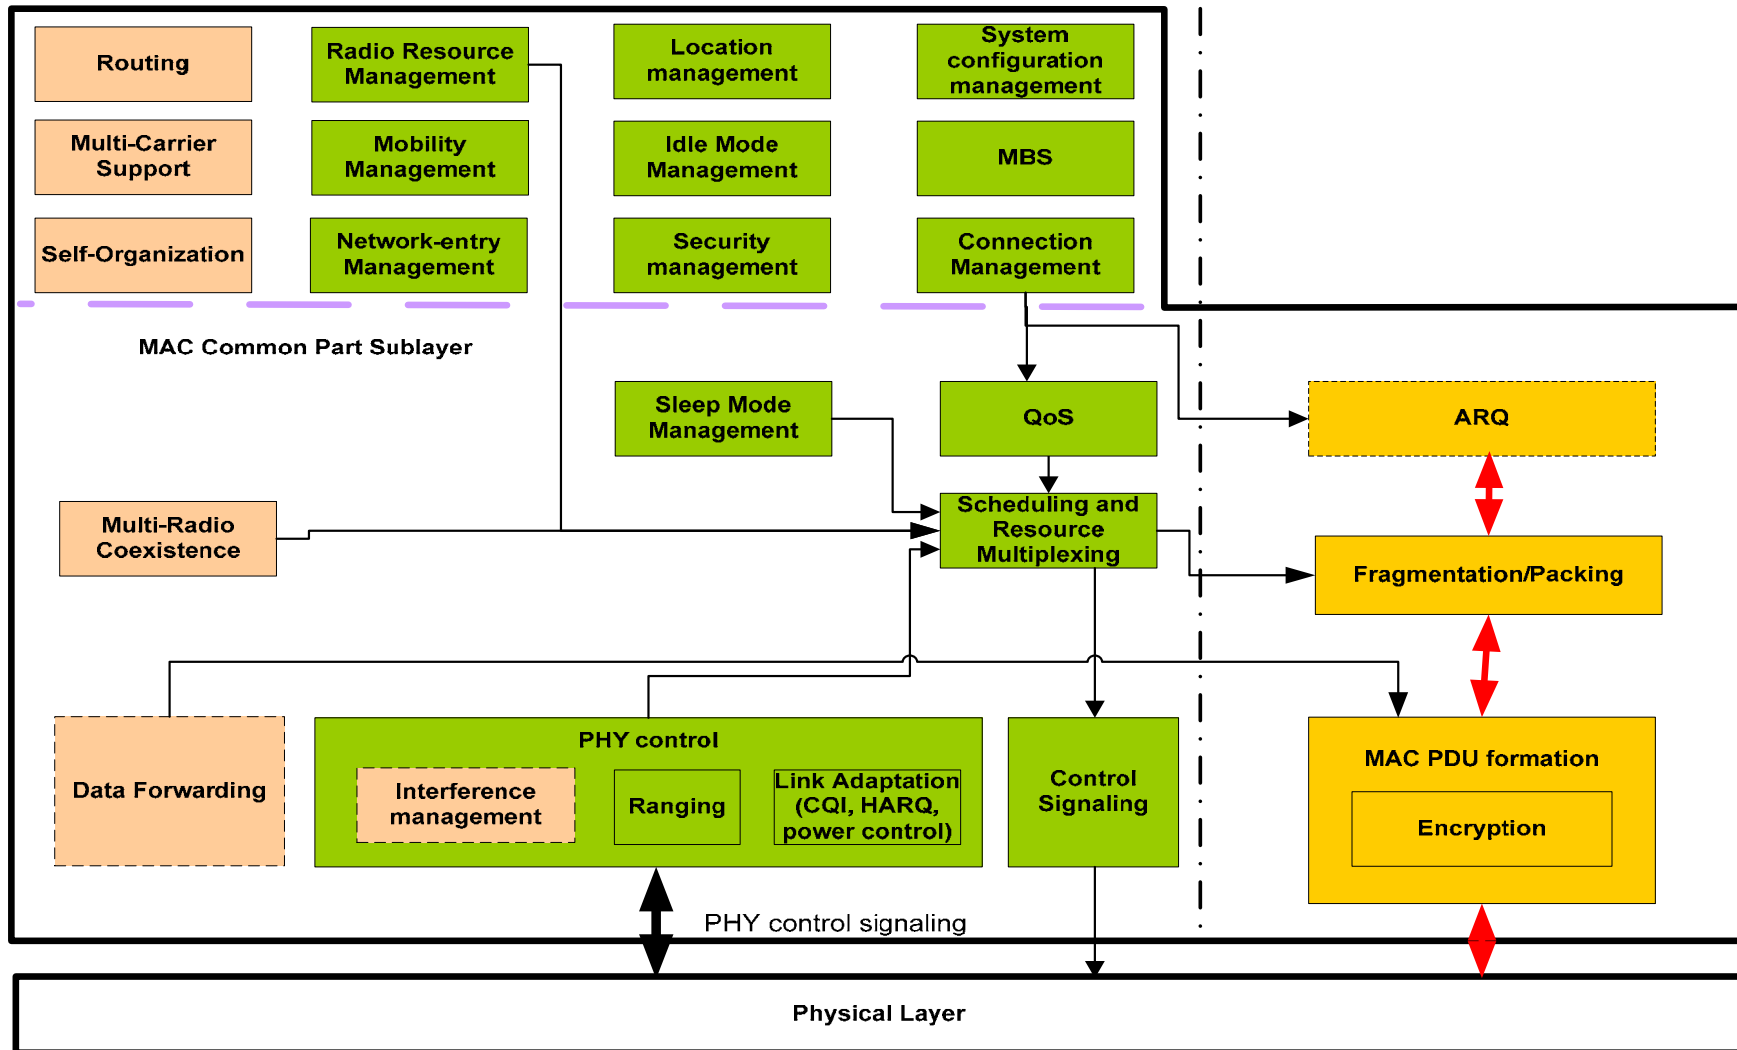

* Note that the Data Forwarding Function applies only to the BS

IEEE 802.16m Protocol Functions for Intermediate Nodes (RS)

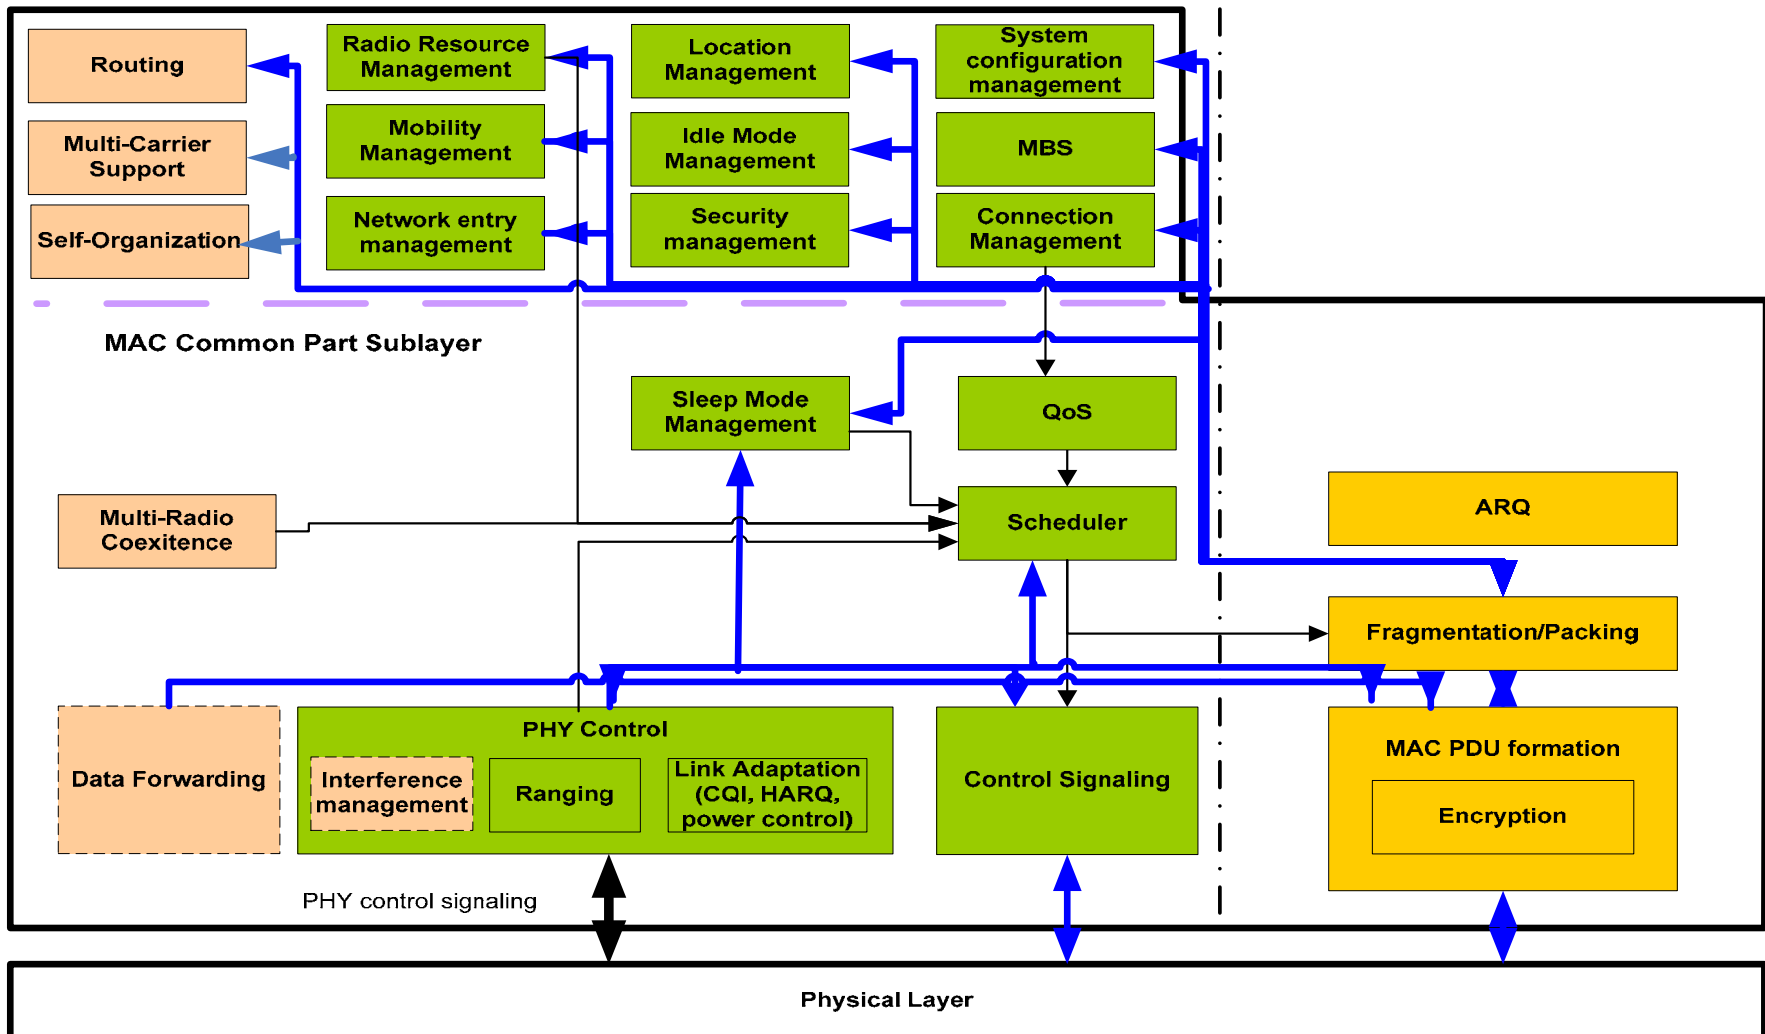

A RS contains a subset of the above-shown functions. The subset of functions depend on the RS type/category.

Data Flow for IEEE 802.16m Intermediate Nodes (RS)

A RS contains a subset of the above-shown functions. The subset of functions depend on the RS type/category.

MAC Signaling Flow for IEEE 802.16m Intermediate Nodes (RS)

A RS contains a subset of the above-shown functions. The subset of functions depend on the RS type/category.
