## Terminology Consistency

The draft varies between calling the functionality Energy Efficient Ethernet (in some cases only Energy is capitalized), EEE, some variant of Low Power Idle (such as low power idle signaling in Clause 22), and LPI. It also varies between "with ___ capability", "supported", "___-compliant" and "implemented" referring to the option's presence. Often these are used where it should say "enabled" because EEE capability is something that can be disabled for backwards compatibility with devices that don't support it.

### Suggested Remedy

Try to be consistent across clauses in referring to this capability especially in the name for the capability. My preference is to use "EEE" as the name for the capability and leave LPI as the name for a signal that is used by that capability.

Review all statements that describe new behavior such as sending of LPI and ensure that they apply only when the capability is enabled. I've tried to catch these and put in specific comments but I may not get them all. 49.2.4.4 contains a good example of what should be done except that "supported" should be "enabled."

### Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.
Proposed responses on D2

IEEE P802.3az D2.0 Energy Efficient Ethernet comments

Proposed Response

There are references in diagrams in either captions or notes that a diagram or a portion of the diagram is optional or "NOTE-Signals and functions shown with dashed lines are optional."

These diagrams, signals and functions are not optional if LPI is supported.

Found in Clause 40, 48, 74

Suggested Remedy

Determining a global consistent manner to highlight what it necessary to support LPI is needed.

For notes in drawing change text to

NOTE- If optional Low Power Idle mode is supported, signals and functions shown with dashed lines are mandatory.

Correct captions to indicate Mandatory if optional Low Power Idle mode is supported.

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type E

The "xMII" notation does not cover XGMII and is inconsistent with other places in the draft where "xxMII" is used

Suggested Remedy

change "xMII" to "xxMII"

PROPOSED ACCEPT.

See response to comment #2
The way that EEE operation has been added to the base clauses for PHYs other than 10BASE-T produces a risk that existing non-EEE PHYs and Reconciliation sublayers will be made non-compliant. The requirements have also been added in a way that will make EEE PHYs incompatible with currently compliant non-EEE devices. My comments on 22.2.2.4 and 22.2.2.7 are examples of where that has happened.

The addition of EEE to IEEE 802.3 should not make existing IEEE 802.3 compliant devices non-compliant. EEE devices should be able to work with non-EEE devices at the xMII and MDI interfaces. It should be optional to support and any new requirements and behaviors should only apply to devices that support EEE/LPI operation. Any behaviors at the xMII or MDI that are outside what is specified for non-EEE devices should only apply when EEE operation is enabled so that EEE devices interoperate properly with non-EEE devices.

**Suggested Remedy**

The safest way to do this would be to create separate clauses for behavior when EEE is enabled similar to the creation of annex 4A for full-duplex, though that would greatly increase the size of the document. The alternative is to carefully use the same type of formula any time you change a requirement for EEE. That is, the old requirement needs to be proceeded by something like "When EEE operation is not enabled," and the new requirement by "When EEE operation is enabled.,".

I have used enabled rather than supported because a device that supports EEE should not exhibit a new behavior when attached to a device that doesn't support EEE. For a PHY, this applies both to the xMII interface when attached to a Reconciliation layer that doesn't support EEE and to the MDI when the link partner PHY doesn't support EEE or isn't able to enable it because the link partner's Reconciliation sublayer doesn't support it.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

**Task force to decide on whether a change will be made to the document structure or whether each specific instance of inconsistency/incompatibility in the description of operation/compliance of non-EEE operation will be addressed.**

**SORT ORDER:** Clause, Subclause, page, line

**PROPOSED ACCEPT IN PRINCIPLE.**
When modifying existing clauses, the change instructions are: change, delete and insert.
For "change" strikethrough and underscore are used to indicate removal of old material and adding of new material respectively.
For "delete" and "insert" normal font is used.
Throughout the draft, this convention is not followed.

Suggested Remedy

The following are example corrections. There are many, many more places that need to be fixed.
Page 15 remove underscore from text added with insert (2 places)
Page 16 show the added text (change) in the clause 14 title with an underscore
Page 24 show the added text (change) in the 14.10 title with an underscore
Page 24 show the changes to LS4 (change)
Page 25 the "22-3" on line 15 should not be underlined
Page 214 remove underscore from text added with insert in 74.5.4
Page 215 remove strikeout text from 74.5.4.1 which has been added with an (insert)

Anslow, Pete Nortel Networks

To be consistent with the base standard "usec" should be shown as the greek letter mu followed by "s"
This occurs in 8 places in the draft and also in Table 78-2 where mu followed by sec should also be mu followed by s

Suggested Remedy

change "usec" to the greek letter mu followed by "s" in 8 places in the draft
change mu followed by sec to mu followed by s in Table 78-2

Proposed Response Response Status W
PROPOSED ACCEPT.

Thaler, Pat Broadcom

Across Clauses 49, 51, 72 and 74 there is a disconnect on what primitives are crossing the interface.
Clause 49 shows energy_detect going up the stack and tx_quiet, rx_quiet, scrambler_reset and rx_lpi_active going down the stack. tx_quiet and rx_quiet appear to be fine and consistent across the Clauses.
rx_lpi_active is defined as an indication in some places but it is a request. indications are signals that go up the stack.
It isn't clear what the benefit of using energy_detect is. The only difference between it and signal_detect is that signal_detect is not produced when there is energy but the FEC hasn't locked yet. Why move the PCS LPI state out of RX_QUIET when the FEC hasn't locked yet?
None of the lower layers use scrambler_reset so the primitive should be removed.

Suggested Remedy

Make the primitive interfaces between these Clauses consistent. Delete scrambler_reset.
Perhaps delete energy_detect and use signal_detect.
Indicate in Clause 49 that rx_lpi_active is only used by FEC and need not be supplied when FEC is not used.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.
The suggested remedy has several requests:
1) As for making the primitives consistent, all the primitives going down are:
tx_quiet.request
rx_quiet.request
rx_lpi_active.request.
There is no need for scrambler_reset to be going from the PCS to lower layers so it will be deleted.
The primitive going up is:
energy_detect.indication
2) We cannot replace energy_detect with signal_detect.
Fundamentally all the three backplane PHYs uses energy_detect (an early signal) to deassert rx_quiet, which in effect wakes up the front end circuits, some of which generates signal_detect. The proposed change defeats the whole purpose of having energy_detect.
3) Indicate in Clause 49 that rx_lpi_active is only used by FEC and need not be supplied when FEC is not implemented.

Comment Type: E  Comment Status: D
Inconsistent format for MII data signals. For example, TXD<3:0> or TXD <3:0>. It doesn't look like the base document is consistent either.

Suggested Remedy
Consult with the WG Chair on preferred format, request he put it on the list of things that could be fixed in a future revision, and used the preferred format throughout.

Proposed Response: Response Status: W
PROPOSED ACCEPT.

As an amendment to IEEE Std 802.3, the material in this draft will eventually be folded into the base standard. When this happens, the definitions for the 100BASE-X and 1000BASE-X Physical Coding Sublayers will be substantially changed, and the changes will be difficult to discern. The definitions for the MII and GMII will also be substantially changed.

The 100BASE-X and 1000BASE-X PCSs are used for many other port types besides 100BASE-TX and 1000BASE-KX. Among these are 100BASE-FX, 100BASE-LX10, 100BASE-BX10, 1000BASE-SX, 1000BASE-LX, 1000BASE-CX, 1000BASE-LX10, 1000BASE-BX10, 1000BASE-PX10, 1000BASE-PX20, 10G/1GBASE-PRX-D/U1, 10G/1GBASE-PRX-D/U2, and 10G/1GBASE-PRX-D/U3.

These port types are not included in the set of objectives for P802.3az, and the specifications for the PCS and MII for these port types must not be changed or effected in any way by P802.3az. Each of these port types must have a current IEEE Std 802.3 PCS and MII to reference.

Suggested Remedy
There are many ways to solve this problem. I prefer the following approach:

1. Preserve the definitions for the MII, GMII, 100BASE-X PCS, and 1000BASE-X PCS without change.

2. Define the changes required to support EEE in a set of normative annexes, i.e. Annex 24A for Clause 24, and Annex 25A for Clause 25, etc. Example text for Annex 24A and Annex 25A have been provided by me to the task force chair.

3. Refer to these normative annexes from the body of Clause 78.

### Comment 190

**Comment Type:** TR  **Comment Status:** D  **doc-structure**

**EEE is modifying some of the earlier 802.3 clauses adding optional EEE/LPI support, some of the state diagram are getting too complicated to know what is required and what is added for EEE**

**Suggested Remedy**

Propose to duplicate the state diagram in earlier clauses instead of changing them so it is clear what is optional EEE

**Proposed Response**  **Response Status:** W  **PROPOSED ACCEPT IN PRINCIPLE.**

See response to comment #410

### Comment 196

**Comment Type:** ER  **Comment Status:** D  **doc-structure**

**The style manual 21.2.1 isn't followed for numbering inserts, where for example, 22.2.2.6A would follow 22.2.2.6, it doesn't precede it and the draft insert instructions do not indicate a convention other than that of the style manual.**

**Suggested Remedy**

Don't insert a TX subclause in the middle of receive subclauses. If the style manual convention is being used, what is currently 22.2.2.6A should be 22.2.2.6. If not following the style manual all change instructions need to be clear about the insertion point. Fix all inserts consistently.

**Proposed Response**  **Response Status:** W  **PROPOSED ACCEPT IN PRINCIPLE.**

### Comment 406

**Comment Type:** ER  **Comment Status:** D  **doc-structure**

**Insert new subclauses with numbering like 7a to avoid renumbering later ones will make the standard more complex to maintain. It also isn't clear what the expectation is when this becomes part of a new edition or revision of 802.3 - will the number-letter designations be retained or will renumbering be done then?**

**Suggested Remedy**

Make 22.7a be 22.7 and renumber the PICS to 22.8. Treat other insertions of new subclauses, figures and tables similarly.

If the current numbering is to be maintained, put in an editorial instruction at the beginning on what is expected when this is integrated into IEEE Std 802.3.

**Proposed Response**  **Response Status:** W  **PROPOSED ACCEPT IN PRINCIPLE.**

See response to comment #196. Note that part of the suggested remedy contradicts that in #196

### Comment 5

**Comment Type:** E  **Comment Status:** D  **doc-structure**

"Add" is not a valid change instruction

**Suggested Remedy**

Propose to add a TX subclause in the middle of receive subclauses. If the style manual convention is being used, what is currently 22.2.2.6A should be 22.2.2.6. If not following the style manual all change instructions need to be clear about the insertion point. Fix all inserts consistently.

Comment Type E Comment Status D

Incorrect style.

SuggestedRemedy

The acronym should be in lower case "low power idle" unless consistently used as a proper
noun throughout the draft. (I don't think capitalization is consistent.)

PROPOSED ACCEPT IN PRINCIPLE.

Will be capitalized consistently but recommend use of Capitals as this term has a specific
meaning beyond what is implied by just the English phrase.

Cl 01 SC 1.5 P 15 L 34 # 109
Chalupsky, David Intel Corp.

Comment Type T Comment Status D

The abbreviation "EEE" is used pervasively throughout this draft before it is defined. Add
an abbreviation definition to section 1.5.

SuggestedRemedy

Add an abbreviation definition to section 1.5., i.e.
"EEE Energy Efficient Ethernet"

PROPOSED ACCEPT.
There are 86 occurrences of "10BASE-T" in 802.3 section 1 not counting the Table of contents and 95 in section 2. This supplement adds 28 occurrences of 10BASE-Te and it added some occurrences of 10BASE-T so it is clear that it has not inserted "or 10BASE-Te" everywhere 10BASE-T occurs in IEEE 802.3. Even just Clause 14 in 802.3 has 44 occurrences of 10BASE-T.

Examples of three places where this causes problems are in Clause 28, Clause 30 and Clause 33.

The draft contains no edits to Clause 28 and its annexes so there is no way to auto-negotiate for 10BASE-Te operation. Bits A0 and A1 of the technology ability field apply to only 10BASE-T. Also 28.2.1.1 still requires "Compliant 10BASE-T MAUs transmit link integrity pulses" for autonegotiation so any device wanting to do auto-neg would still have to deliver the 10BASE-T voltage during auto-neg which defeats some of the purpose of doing 10BASE-Te.

In Clause 30, 10BASE-Te hasn't been added to the MAU types in 30.5.1.1.2 aMAUType.

The draft contains no edits to Clause 33 so it only allows DTE power operation with 10BASE-T and not with 10BASE-Te MAUs.

My preferred solution to this would be to define two subtypes of 10BASE-T operation, e.g. classic (10BASE-Tc) and EEE (10BASE-Te). Use the subtypes where there is a difference between the two such as transmit voltage level. Use 10BASE-T in statements that apply to both subtypes. I can understand the desire to not change the existing meaning of 10BASE-T, but it isn't working and not including the new subtype in 10BASE-Te will cause problems - existing devices won't know that a new technology ability indicates something that is backward compatible with 10BASE-T over the appropriate cable.

If that isn't done, every instance of 10BASE-T in all of 802.3 needs to be examined and modified to include 10BASE-Te as appropriate.

Please fix editorial issues and clarify. Thanks.

Requirements for 10BT and 10BTe are adequately described in the draft text. The first part of the paragraph describes the requirements for 10BT and the second part of the paragraph describes the requirements for 10BTe.

The draft text is clear in stating a minimum requirement for cables for 10BTe. Please suggest a remedy if the draft is ambiguous.
**Comment Type** TR
**Comment Status** D

It is not clear if the 10BASE-Te MAU is a separate type of MAU or a subtype of the 10BASE-T MAU. The way the introductory subclause is written it appears that a 10BASE-Te MAU is a separate distinct MAU type but then if that is true the whole of IEEE Std 802.3 would need to be modified to replace every instance of '10BASE-T' with '10BASE-T and 10BASE-Te' - except where 10BASE-Te has a different requirements from 10BASE-T.

As a simple example consider Clause 13 system considerations for 10Mb/s networks - it has tables that list numbers for 10BASE-T - are these the same for 10BASE-Te or not - similarly for all the mentions for 10BASE-T in Clause 28 Auto-Negotiation.

**Suggested Remedy**

Suggest either [1] replace every instance of '10BASE-T' with '10BASE-T and 10BASE-Te' except where 10BASE-Te has a different requirements from 10BASE-T or [2] state somewhere that the all requirements and specifications for 10BASE-T apply to 10BASE-Te as well unless otherwise stated.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Add statement in section 14.1.1 as follows:

j) All requirements and specifications for 10BASE-T apply to 10BASE-Te as well unless otherwise stated.

<table>
<thead>
<tr>
<th>Cl</th>
<th>SC</th>
<th>P</th>
<th>L</th>
<th>#</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>14.1.1</td>
<td>16</td>
<td>15</td>
<td>345</td>
</tr>
</tbody>
</table>

**Comment Status** D

**Response Status** W

d) The added note seems to imply an implementation, which seems unncessary, given that there are two distinct PHY types already.

**Suggested Remedy**

Delete note.

**Proposed Response**

PROPOSED REJECT.

The note was added in a previous version of the draft to address a reviewer's concern.

<table>
<thead>
<tr>
<th>Cl</th>
<th>SC</th>
<th>P</th>
<th>L</th>
<th>#</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>14.1.1</td>
<td>16</td>
<td>21</td>
<td>114</td>
</tr>
</tbody>
</table>

**Comment Type** E
**Comment Status** D

The grammar of the note is a bit ambiguous - it could be read as expecting that neither is supported.

**Suggested Remedy**

"will support either 10BASE-T or 10BASE-Te." would be more clear. One could also use "will support either 10BASE-T or 10BASE-Te but not both."

**Proposed Response**

PROPOSED REJECT.

See resolution of comment #346.

IEEE P802.3az D2.0 Energy Efficient Ethernet comments

September 2009

Comment Type: T  Comment Status: D

This is not the format used everywhere else for referencing the international (ISO/IEC) and then national (TIA) cabling standards (see page 17, line 13 for an example).

Suggested Remedy:
Change '.. meeting or exceeding the requirements of the Class D channel specified by ISO/IEC 11801:1995 or the Category 5 channel specified in ANSI/TIA/EIA-568-A-1995.' to read '.. meeting or exceeding the requirements of the Class D channel specified by ISO/IEC 11801:1995. This requirement can also be met by Category 5 cable and components as specified in ANSI/TIA/EIA-568-A-1995.'

Proposed Response: PROPOSED ACCEPT.

Comment Type: T  Comment Status: D

I don't think the medium for 10BASE-Te is 'a channel meeting ...', the medium for 10BASE-Te is twisted-pair wire. I believe that it is the performance specifications of the 10BASE-Te simplex link segment that has to meet the Class D channel. (See also similar comment on subclause 14.1.1.2)

Suggested Remedy:
[2] Suggest that 'The medium for 10BASE-Te is a channel meeting or exceeding the requirements of ' be changed to read 'The medium for 10BASE-Te is twisted-pair wire. The performance specifications of the 10BASE-Te simplex link segment is a channel meeting or exceeding the requirements of '.

Proposed Response: PROPOSED ACCEPT.

Comment Type: E  Comment Status: D

14.5.2 mandates that any port that offers MDI-X connectivity shall be marked with an "X". That mandate makes no allowance for current technology in which many PHY implementations are not of a fixed configuration with respect to the cross-over function. I expect many implementations of 10BASE-Te to have automatic MDI-X correction.

Suggested Remedy:
Revise text so that the X labeling requirement only applies to ports with fixed MDI/MDI-X configuration. It would be nice if we could all agree on a single character width symbol for auto-correction.

Proposed Response: PROPOSED REJECT.

This comment makes a change to the base standard that is not impacted by the changes made for 10BASE-Te. It should be submitted as a revision request to the base standard.

Comment Type: T  Comment Status: D

MAU for 10BASE-T in 802.3-2008 does not have any speed designation i.e. point e) does not exist at all. Per draft, MAU should now include designation whether it is 10BASE-T or 10BASE-Te compliant. What about the previously existing MAUs, which do not have such indication - they should be treated as 10BASE-T compliant only?

Suggestion: recommend only indication whether MAU is 10BASE-Te compliant. Lack of any indication will indicate automatically that the given MAU is 10BASE-T compliant. Make an additional note to point e) as provided below.

Suggested Remedy:
change e) to read: "10BASE-Te support (optional). MAU supporting 10BASE-T does not have any labelling for backward compatibility reasons."

Proposed Response: PROPOSED ACCEPT.
The text: "e) 10BASE-T or 10BASE-Te support" is likely to produce a label that ends up saying "Supports 10BASE-T or 10BASE-Te" which is not the intent.

**Suggested Remedy**
Change text to read: "Which of the two specifications is implemented, i.e. '10BASE-T' or '10BASE-Te' (not both)."

**Proposed Response**
PROPOSED REJECT.

See resolution of comment #256.

---

Suggest that '10BASE-T or 10BASE-Te support.' should be changed to read 'Whether 10BASE-T MAU or 10BASE-Te MAU.'.

**Suggested Remedy**
See comment.

**Proposed Response**
PROPOSED REJECT.

See resolution of comment #256.

---

In general, the clause is edited only for 100 Mb/s operation, yet the MII is defined for both 10 and 100 Mbps operation. Text specific to 100 Mb/s operation has to be identified as that.

**Suggested Remedy**
P. 27, L. 25 - change to indicate for 100 Mb/s operation. Fix any others I may not have found.

**Proposed Response**
PROPOSED ACCEPT IN PRINCIPLE.

P.27, L. 12 add (before "The definition of") "LPI signaling is specified for 100Mb/s operation."

p.30, L.41 add (at the end of the paragraph) "LPI signaling is specified for 100Mb/s operation."

---

- clearly state in 22.2.1.3.2 that IF optional LPI implemetned then PLS_CARRIER.indication can be derived from the transmit LPI state machine (also insert the reference Xref/22.7a.2 to be reader-friendly).
- also add optional nature of 22.7a in 22.7a.

**Proposed Response**
PROPOSED ACCEPT IN PRINCIPLE.

To be consistent with other clauses, text needs to be added to highlight the optional nature of LPI. (see also comment #407)

Change "and also from the transmit LPI state machine" to "and the LPI assert function if the optional LPI signaling is supported (see 22.7a.2)"

Add at the beginning of 22.7a "Certain PHYs support Energy Efficient Ethernet (see Clause 78). PHYs that support Energy Efficient Ethernet support Low Power Idle assertion and detection."
### Comment Type: ER (Editorial Required)

**Comment Status:** D (Dispatched)

**Comment:**

> "The definition of low power idle .. " - low power idle is already defined one line above to be equal to LPI, which should be used in this clause thereinafter. Additionally, LPI is in the list of new acronyms. One more reason to use it.

**Suggested Remedy:**

Change occurrences of "low power idle" to "LPI" on (page/line): 22/10, 22/13, 27/25, 27/40 (two occurrences) etc. There are total of 357 occurrences of the term "low power idle" in teh draft, most of which can potentially be replaced with the acronym LPI. Scrub the draft accordingly.

**Proposed Response:**

PROPOSED ACCEPT IN PRINCIPLE.

Reword the sentence to make it clearer:

- Change "low power idle" to LPI in the following locations:
  - p.25, l.10
  - p.27, l.43
  - p.29, l.14
  - p.30, l.4
  - p.30, l.38
  - p.31, l.29
  - p.31, l.34
  - p.31, l.42

- Change "low power idle mode" to "its low power state" on p.25, l.13

- Change "low power idle state" to "low power state" on p.27, l.44; p.28, l.24; p.28, l.29; p.29, l.53; p.30, l.1; p.30, l.5 - also 2 occurrences in fig 22-6a.

---

**Comment:**

> "The definition of low power idle .. " - low power idle is already defined one line above to be equal to LPI, which should be used in this clause thereinafter. Additionally, LPI is in the list of new acronyms. One more reason to use it.

**Suggested Remedy:**

Change occurrences of "low power idle" to "LPI" on (page/line): 22/10, 22/13, 27/25, 27/40 (two occurrences) etc. There are total of 357 occurrences of the term "low power idle" in teh draft, most of which can potentially be replaced with the acronym LPI. Scrub the draft accordingly.

---

**Comment:**

> "The mapping changes slightly when low power idle (LPI) signaling is in operation..." becomes

> "The mapping is changed if the optional low power idle (LPI) signaling is supported..."

**Suggested Remedy:**

Reword the sentence to make it clearer:

**Proposed Response:**

PROPOSED ACCEPT IN PRINCIPLE.

Reword the sentence to make it clearer:

- "The mapping changes slightly when low power idle (LPI) signaling is in operation..."

- "The mapping is changed if the optional low power idle (LPI) signaling is supported..."
The text as altered reads "The values CARRIER_ON and CARRIER_OFF can be derived from the MII signal CRS and also from the transmit LPI state machine," which is a far different statement from the original, which said "The values CARRIER_ON and CARRIER_OFF are derived from the MII signal CRS."

The "can be ... and also" construction is so ambiguous as to have no meaning.

**Suggested Remedy**

Move the transmit LPI state machine into the 100BASE-X PCS with LPI annex, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

**Response Status W**

PROPOSED ACCEPT IN PRINCIPLE.

The response to comment #470 removes the ambiguity and makes the optional nature of LPI clear.

The response to comment #165 addresses the use of the state machine in the RS.

This comment would be unaffected by changes to the structure of document as described.

---

We don't have state machines in the standard, we have state diagrams, and I believe the LPI operation is split into the LPI assert and detect functions (at least in Clause 78). The text is also not properly marked ('can be' is not underscore). There is no reason to weaken the statement from an "are" to a "can be".

**Suggested Remedy**

The values CARRIER_ON and CARRIER_OFF are derived from the MII signal CRS and if implemented the LPI assert function (78.1.3).

**Proposed Response**

**Response Status W**

PROPOSED ACCEPT IN PRINCIPLE.

The response to comment #470 rewords the sentence.

**Comment Status D**

**Response Status W**

PROPOSED ACCEPT IN PRINCIPLE.

If PLS_CARRIER.indication is driven differently for LPI operation, then this paragraph needs to be qualified to only apply when not in LPI operation.

Also, LPI operation is used several places but never defined - for example, is a device "in LPI operation" only when LPI is being sent or is it when LPI has been enabled even though it may not be being sent at the moment?

**Suggested Remedy**

Define "LPI operation" and when a behavior only applies when not in LPI operation, add that limitation.

**Proposed Response**

**Response Status W**

PROPOSED ACCEPT IN PRINCIPLE.

Reword the opening part of the paragraph:

"For LPI operation, in full duplex mode RX_DV and CRS have no influence on CARRIER_STATUS."

Becomes:

"If the optional LPI function is supported then CARRIER_STATUS is overridden according to the behavior of the LPI transmit state diagram (see fig. 22-21). The signal CRS has no effect on CARRIER_STATUS while in states LPI_ASSERTED and LPI_WAIT."
Comment Type: ER
Comment Status: D
What does the editor's instruction mean? How is 22.2.2 to be changed to show LPI signaling? This applies to the other places where this instruction is given with no change to the subclause shown. And where there is a change shown, the editing instruction doesn't need to say "for LPI signaling"

Suggested Remedy
Make the instructions clear.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Instruction removed in response to comment #4

Comment Type: TR
Comment Status: D
This says:
Change 22.2.2 to show LPI signaling: 22.2.2 MII signal functional specifications
Change 22.2.2.2 for clock definitions:

There is no change to 22.2.2 shown before the change to 22.2.2.2

Suggested Remedy
either show a change to 22.2.2 or remove the first of the two change instructions

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Remove the first change instruction and the heading for 22.2.2
The addition of TX_ER here changes the requirements for non-EEE 100BASE-TX PHYs. In the existing 802.3 standard, when TX_ER is asserted while TX_EN, the PHY is required to insert an error somewhere in the frame but that is not required to happen at the time TX_ER is asserted. Therefore, in the current IEEE 802.3 standard TXD<3:0> may effect the PHY during the time that TX_ER is asserted.

The added new behaviors in the next paragraph and in Table 22-1 are written such that they apply to all 100BASE-T PHYs and would make existing 100BASE-T PHYs non-compliant. 802.3az should not make changes that make a compliant 100BASE-T PHY non-compliant. Any changed requirement should only apply to PHYs supporting an EEE option when EEE is enabled.

Suggested Remedy
Rewrite the changes to this subclause so that they only apply to devices when EEE operation is enabled. That may require insertion of a separate table for EEE PHYs or a column to indicate that a row in the table only applies to EEE operation and is treated as reserved by non-EEE PHYs.

Proposed Response
PROPOSED REJECT.

The text states that "while TX_EN and TX_ER are both deasserted, TXD<3:0> shall have no effect on the PHY."

The commenter then highlights conditions where one or other of TX_EN and TX_ER are asserted. Therefore the text is entirely compatible with the behavior required. It should be noted that the current standard requires that TXD<3:0> has no effect on the PHY whenever TX_EN is deasserted. The change makes a single exception for the condition where TX_EN is deasserted, TX_ER is asserted and TXD<3:0> = 0001.

Awkward and possibly misleading text.

Suggested Remedy
The PHY shall interpret the combination of TX_EN deasserted, TX_ER asserted and TXD<3:0> equal to 0001 shown in Table 22-1 as a request to enter, or remain in low power idle. Other values of TXD<3:0> with this combination of TX_EN and TX_ER shall have no effect upon the PHY.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Also change in the same style as suggested by comment #479

"If the optional LPI function is supported, the RS shall use the combination of TX_EN deasserted, TX_ER asserted and TXD<3:0> equal to 0001 shown in Table 22-1 as a request to enter, or remain in low power idle. Other values of TXD<3:0> with this combination of TX_EN and TX_ER shall have no effect upon the PHY."

The first part of the remedy solves the issue raised, the second part is irrelevant since the text would have the same wrong effect whether the draft is restructured or not.

The response to comment #195 removes the issue.

To allow Clause 78 to refer globally to the same encoding on the MII, GMII and XGMII, as well as just being a good idea, I believe that the encoding on the receive path of the MII, GMII and XGMII when the PHY is receiving the Low Power Idle on its RX MDI should have the same description. At the moment we have:

MII  Receive low power idle
GMII  Assert low power idle
XGMII  assert low power idle
79.1.3.2 assert low power idle

I suggest that for consistency we use 'assert low power idle'.

Suggested Remedy
- Change 'Receive low power idle' in Table 22-2 to read 'Assert low power idle'.
- Also make this change:
  
Page 29, line 46
Page 40, line 17
Page 68, line 40
Page 105, line 15
Page 105, line 20
Page 115, line 1
Page 115, line 12
Page 124, line 1

Proposed Response  Response Status  W
PROPOSED ACCEPT.

Note that this effects clauses 22, 24, 35, 40, 45, 46

Comment Type  E  Comment Status  D
Text is confusing "When the PHY receives signals from the link partner to indicate transition into the low power state it indicates this to the LPI client by asserting RX_ER and setting RXD<3:0> to 0001 while keeping RX_DV deasserted." Consider adding commas or dividing the sentence into two logical blocks.

Suggested Remedy
- Per comment

Proposed Response  Response Status  W
PROPOSED ACCEPT IN PRINCIPLE.

Add a comma as shown:

"When the PHY receives signals from the link partner to indicate transition into the low power state, it indicates this to the LPI client by asserting RX_ER and setting RXD<3:0> to 0001 while keeping RX_DV deasserted."

Comment Type  E  Comment Status  D
"While the PHY device is indicating low power idle it may halt the RX_CLK at any time more than 9 clock" is missing a comma (,).

Suggested Remedy
- Change to "While the PHY device is indicating LPI, it may halt the RX_CLK at any time more than 9 clock"

Proposed Response  Response Status  W
PROPOSED ACCEPT.
Proposed responses on D2

**Comment Type**: TR  **Comment Status**: D

This indicates that RX_CLK may be stopped which is not consistent with 22.2.2.2 which says that RX_CLK is continuous and only says that it may be high or low for a period not to exceed twice the nominal clock period.

**Suggested Remedy**

Make the subclauses consistent. If RX_CLK is stoppable, that needs to be indicated in 22.2.2.2.

**Proposed Response**  **Response Status**: W

PROPOSED ACCEPT IN PRINCIPLE.

Add to the end of the paragraph finishing on p.27, l.29.

"RX_CLK may be stopped by the PHY during LPI when Clock stop enable is asserted (see 22.2.2.9a and 45.2.3.1.3a)"

The sentence "The notation ++ after a counter indicates it is to be incremented" appears to be superfluous.

**SuggestedRemedy**

Delete the sentence, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

The sentence is superfluous and should be deleted. The superfluidity of the sentence would be unaffected by any change to the document structure.
Proposed responses on D2

The statement "Condition that is true until such time as the power supply for the device that contains the RS has reached the operating region" sounds pretty vague. What about the L.O.? What about power-on transients? This is an example of why it is a bad idea to have state machines in the RS/MII clause.

Suggested Remedy
Move this state machine into the 100BASE-X with LPI PCS annex, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

PROPOSED ACCEPT IN PRINCIPLE.

The concept of "power on reset" is well understood by most people who are competent to implement an Ethernet PHY. However, using the name "reset" might cause some confusion.

Add the variable "power_on"
"Condition that is true until such time as the power supply for the device that contains the RS has reached the operating region."
Values: FALSE; The device is completely powered (default).
TRUE; The device has not been completely powered.

Change name of "reset" to "rs_reset" with definition:
"Used by management to control the resetting of the RS"
Values: FALSE; Do not reset the PCS.
TRUE; Reset the PCS.

Change the condition "reset" to "rs_reset + power_on"

See also #165 regarding the use of a state machine in the RS.

Note that this comment has equal validity whether the document structure is preserved or changed.

Frazier, Howard
Broadcom Corporation

Comment Type TR Comment Status D

A state diagram in the MII clause. Wow. Why can't the PHY assert/deassert the CRS signal to indicate when the transmit path is in LPI?

Suggested Remedy
Take out the state diagram. The 100BASE-TX PHY with LPI should be responsible for asserting and deasserting CRS, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

PROPOSED REJECT.

The state machine in the Reconcilliation Sublayer was the cornerstone of the baseline (law_01_1108) that was adopted by the Task Force.

It was considered advantageous to have the control of the PLS_CARRIER.indication in the RS for a number of reasons:

1. It keeps the PHY receive and transmit paths separate (the PHY considers CRS to be part of the receive path).
2. It allows the PHY to go to sleep without having to maintain state & control the wake process.
3. It keeps the "data holdback" function close to the MAC and egress buffers, where it would be implemented in most designs.
4. It frees the PHY from having to participate in the wake time negotiation process (that is controled using LLDP frames).
5. It works for PHYs that operate at speeds greater than 1Gbps, so the same mechanism can be used for all speeds.

The state diagram would be present (or deleted according to the comment) whether the proposed changes to the document are accepted or not.

<td>The cross reference for Tw_sys is wrong and it would match the text in clause 78 better if &quot;Transmit Tw_sys&quot; was given as &quot;Tw_sys_tx&quot;.</td>
<td>Replace the crossreference to &quot;78.4.2.3&quot; with &quot;78.2&quot; and change &quot;Transmit Tw_sys&quot; to &quot;Tw_sys_tx&quot; to match the parameter names in that section.</td>
<td>D</td>
<td>W</td>
</tr>
</tbody>
</table>

**Proposed Remedy**

1. The PHY may restart RX_CLK at any time while it is asserting LPI, but shall restart RX_CLK so that at least one positive transition occurs before it deasserts LPI.

2. The arrival of new receive data is controled by Tw and is described in Clause 78.

**Proposed Acceptance in Principle**

3. Use the variable name & xref from comment #367.

4. The variable used in this section should be Tw_sys_rx, with xref 78.5.

**Proposed Acceptance**

5. Remove the PLS_CARRIER.indication line for consistency with other figures.

**Proposed Reject**

6. The "mixing two sides of the RS" is fundamental to the behavior because the PLS_CARRIER.indication is being derived from the state of the transmit control/data signals.

signal_status is only used for LPI portion of the statemachine, but the description does not indicate as such (missing, and not reader-friendly at best). This signal was used in normal operation to drive link monitor statemachine (24.3.4.4). It is not clear whether 3ax PHY were to implement 24.3.4.4 link monitor statemachine and turn it off (or not!) if option is not used. Also not clear what normal PHY were to implement after all the changes are integrated.

**Suggested Remedy**

Adopt Nomative Annex (or equivalent), or

Clarify the relationship between this state variable use in the RX statemachine and link monitor statemachine.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

The signal_status is generated by PMD and is used by optional LPI mode of Receive state machine as well as by Link Monitor state machine and Far-End Fault state machine. It has been shown in Functional block diagram of Figure 24-4.

In order to clarify the role of signal_status in RX, a statement is added at the end of the paragraph in line 43 of page 39 as follows:

" A continuous indication of signal detection on the channel through signal_status as communicated by the PMD_SIGNAL.indicate primitive is used to control the transitions among different states in idle mode as depicted in Figure 24-11b. "

**Cl 24 SC 2.4.2**

Kim, Yong

Broacom

**Comment Type** T  **Comment Status** D

In idle state, for a PHY, if TXD[3:0]=TX_LP_IDLE, the transition to the optional implementation must be taken. Or TX_ER=TRUE path to START ERROR J state transition must be taken, if option is not implemented. It is not (technically) clear, since TX_ER defined in 22.2.1.6 and 22.2.2.5(originally intended to "repeat" data errors) could take on any value (and the text says, not required to implement in RS, shall implement in PHY, and may implement in MAC) including TX_LP_IDLE, coincidentally.

**Suggested Remedy**

Adopt Nomative Annex (or equivalent), or

Adding text to 22.2.1.6 to address this concern -- but I see catch 22 -- perhaps the TG could address this better. If we add text to avoid TX_LP_IDLE, then we are changing the legacy PHY.

**Proposed Response**

PROPOSED ACCEPT.

Based on Fig 24-8, if the idle mode option is not implemented, the IDLE state will stay unchanged when it receives TXD[3:0]=TX_LP_IDLE*TX_EN=FALSE*TX_ER=TRUE. Therefore, it will not move to "START ERR J" state at all.

**Cl 24 SC 24.1.1**

Thompson, Geoff

GraCaSI

**Comment Type** TR  **Comment Status** D

There is mention of an "LPI agent" in this clause as the active element that causes the 100BASE-X PHY to go back and forth between LPI and normal operation. I find it strange that (a) there is no definition or specification of an LPI agent nor even any mention of it anywhere else in the draft, not even in the other clauses where one would expect a parallel use of such an agent to cause the same sort of switch for the other LPI PHYs (except 10BASE-Te)

**Suggested Remedy**

Fully define and specify the operation and service interfaces for the activating function for LPI (be it an "LPI agent" or other mechanism). Further, have that mechanism act on each of the LPI PHYs in a manner that is architecturally consistent across the entire standard.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Please refer to comment #230 for the suggested modification

Need clarification of the function of LPI agent across the entire draft. Pending on the discussion result of Chicago meeting.

IEEE P802.3az D2.0 Energy Efficient Ethernet comments

September 2009

Comment Type: T  Comment Status: D  230

"Energy is conserved by deactivating some or all functional blocks." - blocks in what exactly? In Tx PHY and Rx PHY in the peer? If so, state that clearly.

Suggested Remedy

Per comment

Proposed Response  Response Status: W

PROPOSED ACCEPT IN PRINCIPLE.

Rewrite this statement and the next sentence as follows:

"The transmit and receive paths can enter and exit low power states independently. Energy is conserved by deactivating the corresponding functional blocks of individual path."

Comment Status: D  Response Status: W

"The only 100BASE-X PHY that supports this capability is 100BASE-TX" - it seems easier to say "From all 100BASE-X PHYs, only 100BASE-TX supports this capability".

Suggested Remedy

Per comment

Proposed Response  Response Status: W

PROPOSED ACCEPT IN PRINCIPLE.

Change the statement to:

"From all 100BASE-X PHYs, only 100BASE-TX supports this optional capability"
**Comment Type: T**  **Response Status: W**

PROPOSED ACCEPT IN PRINCIPLE.

Rewrite the point g) as follows:
"Optionally support Energy Efficient Ethernet through the function of low power idle (LPI - see Clause 78), available only for 100BASE-TX."

**Comment Type: T**  **Response Status: W**

PROPOSED ACCEPT IN PRINCIPLE.

Add a note (at the beginning of 24.2.2):

Note: The state diagram conventions described in 24.1.7 apply to all of the state diagrams in this clause.

**Comment Type: T**  **Response Status: W**

These two questioned lines are from the diagram of original standard.

What is more, the solid line goes to FAR-END FAULT DETECT should be solid since it is part of a line from Transmitter process all the way to TX process which is not an option.

---

**Comment Type: T**  **Response Status: D**

point g) is not entirely clear. What messages are intended to be transmitted to a reader in here?

**Suggested Remedy**

Suggest to change point g) to read "Support Energy Efficient Ethernet, with the optional function of low power idle (LPI - see Clause 78), available only for 100BASE-T.". Also, what is intended as optional in this case - support for EEE or LPI? Can EEE be supported without LPI?

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Rewrite the point g) as follows:
"Support Energy Efficient Ethernet, with the optional function of low power idle (LPI - see Clause 78), available only for 100BASE-T.".

**Comment Type: T**  **Response Status: D**

What is "MII opcode"? in the existing standard, I could only find references to "MII nibbles" - is this the same?

**Suggested Remedy**

Clarify what "MII opcode" is ...

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Change "MII opcode" to "MII data code-groups and signals".

---

**Comment Type: T**  **Response Status: D**

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

**Suggested Remedy**

The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Add a note (at the beginning of 24.2.2 and 24.3.3):

Note: The state diagram conventions described in 24.1.7 apply to all of the state diagrams in this clause.

What is the 'low power state' - is this the same as 'low power idle mode'? **Suggested Remedy**

The 0000 code group, defined as /P/ for EEE, will still be an invalid code group for a "classic" 100BASE-X PHY. This amendment should not mandate that devices that have treated 0000 as an invalid code for the last 17 years are suddenly non-compliant. **Suggested Remedy**

Implement the Suggested Remedy in my general comment concerning the structure of the draft amendment. **Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE. **Response Status**

Modify the interpretation field of 0000 code group as follows:

SLEEP; Low Power Idle code if LPI mode is implemented and enabled. Otherwise, Invalid code; refer to Table 22-1 and Table 22-2
What is the "low power transmit state" - is this the same as "low power idle transmit state"? If so, do not create new terms but use existing ones. This term is used later on in the text. Scrub teh draft accordingly.

The low power transmit state and receive state are adopted in an early meeting motion. It may have been overlooked.

Rewrite the original sentence in line 12 as follows:

"The 100BASE-X PCS accepts LPI commands from the RS and MII (Table 22-1) to put the transmit path on low power idle mode. The PCS returns to the normal mode when it detects the termination of the LPI command."

Replace "low power transmit state" with "transmit path on low power idle mode" in the following places:
- line 48 of page 40
- line 46 of page 49
- line 48 of page 196
- line 41 of page 202
- line 38 of page 209

Replace "low power transmit state" with "low power idle mode" in the following places:
- line 49 of page 41
- line 54 of page 41
- line 34 of page 49
- line 52 of page 53

</tbody>
</table>

**Suggested Remedy**

Per comment

**PROPOSED ACCEPT IN PRINCIPLE.**

The low power transmit state and receive state are adopted in an early meeting motion. It was used here since then.

Rewrite the original sentence in line 43 as follows:

"Upon successfully receiving SLEEP code-groups, the 100BASE-X PCS put the receive path on low power idle mode.."

Replace "low power receive state" with "receive path on low power idle mode" in the following places:

- line 41 of page 40
- line 25 of page 196 (Clause 70.6.10)
- line 29 of page 202 (Clause 71.6.12)
- line 16 of page 209 (Clause 72.6.11)

Replace "low power receive state" with "low power idle mode" in the following places:

- line 25 of page 40
- line 32 of page 40
- line 37 of page 40
- line 14 of page 41
- line 20 of page 41
- line 29 of page 41
- line 35 of page 41
- line 41 of page 41
- line 15 of page 45
- line 21 of page 45
- line 41 of page 45
- line 09 of page 46
- line 15 of page 46
- line 16 of page 46
- line 35 of page 47
- line 12 of page 49
- line 29 of page 53
Three new constants are defined and not two ....

Fix the editorial description. Usually, no number is provided. May change to "Insert new constants in alphabetical order in the list below?"

Implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

Add the following sentence at the end of description of each variable:

"This variable is implemented only if LPI mode is implemented."

"This timer is implemented only if LPI mode is implemented."

This variable tx_quiet as well as these states TX_SLEEP and TX_QUIET are available and used only if the EEE option is implemented.

Since this part of state machine is enclosed with a dashed block with a note saying optional implementation, it will not be tested by legacy PHY.
In the transmit state diagram, a bug that I pointed out at the last 802.3 plenary session was addressed by eliminating the transition condition from "IDLE" back to "IDLE" because this transition condition conflicted with the transition from "IDLE" to "TX_SLEEP". The primitive sentCodeGroup.indicate is used to pace the transitions in this diagram so that tx_bits[4:0] gets a value assigned only upon receipt of sentCodeGroup.indicate. Therefore, I would like to see the transition condition from "IDLE" back to "IDLE" restored.

**Suggested Remedy**

Add the transition condition

```
sentCodeGroup.indicate * 
TX_EN=FALSE * 
(TX_ER=FALSE + (TX_ER=TRUE * TXD[3:0] {is not equal to} TX_LP_IDLE))
```

from "IDLE" back to "IDLE",

and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

PROPOSED REJECT.

The function is equivalent.

---

**Comment Type** TR  **Comment Status** D

**Comment**

Why was the transition condition from the state "CARRIER DETECT" to the state "BAD SSD" changed from \text{rx\_bits}[9:0] \{not equal to\} /I/J/ to \text{rx\_bits}[9:0] \{not equal to\} /I/J/ ? The trailing slash indicates that /J/ is a code group.

**Suggested Remedy**

Change the transition condition back to be \text{rx\_bits}[9:0] \{not equal to\} /I/J/

and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

The transition condition from the state "CARRIER DETECT" to the state "BAD SSD" is changed from \text{rx\_bits}[9:0] \{not equal to\} /I/J/ to \text{rx\_bits}[9:0] \{not equal to\} 1111111000 .

---

**Comment Type** TR  **Comment Status** D

**Comment**

A 100BASE-X PHY that pre-dates P802.3az will not comply with this receive state diagram, because it will not take the branches from states "IDENTIFY JK" and "BAD SSD" of to part B of the diagram.

This will have the effect of making billions of existing 100BASE-TX PHYs not compliant with IEEE Std 802.3. This is a bad thing.

**Suggested Remedy**

See my general comment concerning the structure of the draft amendment.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Frame these two branches to part B with dashed line block and make a note saying: "Optional Implementation"
Cl 24 SC 24.2.4.4 P 43 L 20 # 149
Frazier, Howard Broadcom Corporation

Comment Type TR Comment Status D
Why was the transition condition from the state "CARRIER DETECT" to the state formerly known as "CONFIRM K" changed from rx_bits[9:0]=/I/J/ to rx_bits_[9:0]=1111111000 ? These should be equivalent.

This sort of change obfuscates the real set of changes that are needed to support EEE, and will cause unnecessary confusion.

Suggested Remedy
Change the transition condition back to rx_bits[9:0]=/I/J/
and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

Proposed Response Response Status W
PROPOSED REJECT.

During the transition from IDLE patterns (5b11111) to SLEEP pattern (5b0000) the receiver will identify a "bits" pattern with 10b1111111000, which is equivalent to /I/J/ due to the serial shift-in operation. That's why in Fig 14-11a the branch condition from CARRIER_DETECT to IDENTIFY_KJ (note that the name changed from the original CONFIRM_K) is 'rx_bits[9:0]=1111111000' instead of misleading 'rx_bits[9:0]=/I/J/' even though these two equations are identical in contents. We avoid using /I/J/ because they may not be in correct symbol boundary.

Comment Type TR Comment Status D
It appears that a single bit error in a /K/ in the SSD /J/K/ can synthesize the sequence rx_bits[9:0] = /I/P/. In the "classic" 100BASE-X receive state machine, this would be counted as a BAD SSD, a packet would be discarded, and life would go on. In this new 100BASE-X receive state machine, it appears that such a single bit error in a /K/ will send the state machine to START_RX_SLEEP.

Suggested Remedy
May want to consider a more robust transition condition for going to sleep, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

Proposed Response Response Status W
PROPOSED REJECT.

The /J/K/ has bits pattern 1100010001.
The /I/P/ has bits pattern 1111100000.

I don't see it possible that any bit error happens in /K/ can cause an mis-interpretation of /I/P/.

Comment Type TR Comment Status D
This looks like an accidental typo in the receive state diagram, but it demonstrates the kind of inadvertent damage that can be done when significant changes are made to existing specifications.

It appears that there is a mistake in the transition condition from the state "RECEIVE" to the state "DATA". The transition condition in the draft is gotCodeGroup.indicate * rx_bits[9:5] [is not an element of] DATA. I believe that this transition condition should be gotCodeGroup.indicate * rx_bits[9:5] [is an element of] DATA.

Suggested Remedy
Change the transition condition to be gotCodeGroup.indicate * rx_bits[9:5] [is an element of] DATA,
and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Change the transition condition from the state "RECEIVE" to the state "DATA" to gotCodeGroup.indicate * rx_bits[9:5] [is an element of] DATA,

Per comment

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Add a new bullet (e) on 24.3.2
"(e) Optional Low Power Idle mode, which disables the Far-End Fault function and modifies the link down condition with the PMA_RXLPI.request primitive."

Add a new subclause
"24.3.2.3 Low Power Idle Mode
The Low Power Idle mode, when implemented and enabled as communicated by PMA_RXLPI.request primitive, affects PMA in two ways. It must disable the operation of Far-End Fault process due to the frequent on and off activity of signal_status when line state is changed between quiet state and other non-quiet states. It also receives additional link failure detection signal as communicated by PMA_LPILINKFAIL.request primitive and changes the Link Monitor state machine to allow an exit from low power state to link down state on faulty situation."

Modify 24.8.2.3 as follows
*LP1 support PCS LPI function 24.2.2.5
*LP2 support PMA LPI function 24.3.2.3

Cl 24 SC 24.8.2.3 P 51 L 10 # 474
Kim, Yong Broadcom

Comment Type T Comment Status D LATE
Shouldn't PICs for PCS (this clause) and PMA (25.5) be aligned? Meaning the standard does not prevent PCS to have .3az option and PMA not, which is fine. But there is no indication that .3az option ought to be implemented in both or neither. Perhaps there is a better place to specify (or recommend). .3az option to be implemented consistently, and have PICS reflect the resulting text.

Suggested Remedy
Should be T (not TR) but submitted after comment submission deadline. If adopting Nomative Annex (or equivalent) approach, there may be a good place to include this comment.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Add a new subclause
"24.3.2.3 Low Power Idle Mode
The Low Power Idle mode, when implemented and enabled as communicated by PMA_RXLPI.request primitive, affects PMA in two ways. It must disable the operation of Far-End Fault process due to the frequent on and off activity of signal_status when line state is changed between quiet state and other non-quiet states. It also receives additional link failure detection signal as communicated by PMA_LPILINKFAIL.request primitive and changes the Link Monitor state machine to allow an exit from low power state to link down state on faulty situation."
**State diagram conventions**

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear. The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

**Proposed Remedy**

Insert new subclause:

25.1.1 State diagram conventions

The body of this standard is comprised of state diagrams, including the associated definitions of variables, constants, and functions. Should there be a discrepancy between a state diagram and descriptive text, the state diagram prevails.

The notation used in the state diagrams follows the conventions of 21.5; state diagram timers follow the conventions of 14.2.3.2.

**Proposed Response**

PROPOSED ACCEPT.

---

**Comment**

It is not necessary to reproduce Table 25-1 in P802.3az. It appears that it was included in the draft only for the sake of adding three rows to the end of the table for the three new service primitives introduced by EEE. The purpose of the table, however, is to present a mapping of FDDI terms or concepts into 100BASE-TX terminology. Since there is no comparable mapping of the new service primitives into FDDI terms or concepts, there is no need to include them in the table.

**Proposed Remedy**

Delete the table, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Remove the change to Table 25-1.

---

**Comment**

This is not a problem introduced by EEE or P802.3az. I have submitted a maintenance request on this topic. The maximum stream size parameter in Table 25-1 is incorrect, and should have been updated by 802.3as frame format extensions.

**Proposed Remedy**

I believe that the correct value for maximum stream size is 4018 code-groups. If the task force persists in reproducing this table in the draft amendment, this change should be made. I think that a better solution is to delete the table (see associated comment) and leave it to maintenance to change the parameter.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

---

Comment Type: TR  Comment Status: D  

**Proposed Response:**

I suggest that EEE resolution should occur after priority resolution for PHY selection. If both sides support EEE for the selected PHY type, then EEE operation is enabled.

**Suggested Remedy:**

There is no need to add EEE to the priority resolution table as the EEE support resolution is simple and amply described in clause 78. This approach has worked adequately for 1000BASE-T MASTER/SLAVE resolution and many other more complex ability exchanges.

---

**Comment Status:** D  
**Response Status:** W

**Proposed Response:**

**Suggested Remedy:**

(The TF will discuss making Extended Next Page mandatory, if this is rejected then the following response applies.)

Delete message code 11 from the table and delete 28C.13 add the following to 28C.12:

"For PHYs that negotiate extended next page the EEE advertisement is sent as part of the 100GBase-T/1000Base-T technology message defined in 55.6.1."

---

**Comment Status:** D  
**Response Status:** W

**Proposed Response:**

"at least one unformatted next page" A message should be fixed format.

**Suggested Remedy:**

use "one unformatted next page" - there are currently only 6 EEE auto-neg PHY types and if you are concerned about running out of the 11 bits, you could do separate bit map assignments for BASE-T and backplane PHYs.

**Proposed Response:**

PROPOSED ACCEPT.
Proposed responses on D2

This comment also applies to 28C.13. The exact placement of the data in the message needs to be specified. It would be better to do this in a format that is similar to what is done for other next page messages.

Also, for unformatted next page, you don’t say which register bit corresponds to which bit in the unformatted next page. (This last part is the reason for the TR.)

Suggested Remedy
See 40.5.1.2 and 55.6.1 for examples.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

This is a change to 45.2.7.13a

Add a column to Table 45-145 for unformatted next page bit number.

**Comment Type T**

Perhaps already addressed in .3az (in which case, ignore this comment).
Pause/Flow control use of the MAC Control - should it benefit from LPI/EEE?
LPI timing and Pause timing overlap enough to make explicit statement (allowed, not allowed, orthogonal, etc).

**Suggested Remedy**

Should be T (not TR) but submitted after comment submission deadline.
Consider specifying relationship between .3az and clause 31, if not yet considered.

**Proposed Response**

Nothing has been proposed as part of 802.3az that would require any change to the operation (or the documentation) of Clause 31.

**Suggested Remedy**

Should be T (not TR) but submitted after comment submission deadline.
Consider specifying relationship between .3az and clause 31, if not yet considered.

**Proposed Response**

Nothing has been proposed as part of 802.3az that would require any change to the operation (or the documentation) of Clause 31.

**Proposed Response**

Please make it so.

**Proposed Response**

The inserted notes "NOTE-GTX_CLK may be halted during periods of low utilization according to 35.2.2.6a." and "NOTE-RX_CLK may be halted during periods of low utilization according to 35.2.2.9a." is not clear whether this note applies to legacy PHY (pre-3az).

**Proposed Response**

Comment #461 resolves this.
The text "The PHY shall interpret the combination of TX_EN, TX_ER and TXD<7:0> as shown in Table 35-1 as an assertion of low power idle. Transition into and out of the low power idle state is shown in Figure 35-6a." breaks the legacy PHY and [unintentionally] make all systems based on legacy PHY non-conformant.

Suggested Remedy

Should be TR but submitted after comment submission deadline.

Adopt Nomative Annex (or equivalent), or

Add optional implementation wording text or correct via reference.

Proposed Response Response Status W PROPOSED ACCEPT IN PRINCIPLE.

The use of a "shall" that applies to the PHY is not appropriate, therefore reword:

"If the optional LPI function is supported, the RS shall use the combination of TX_EN deasserted, TX_ER asserted and TXD<7:0> equal to 0x01 shown in Table 35-1 as a request to enter, or remain in low power idle."

Note that this error would have equal effect whether contained in this clause or a separate annex.

The text "While RX_DV is de-asserted, the PHY may provide a False Carrier indication or assert low power idle by asserting the RX_ER signal while driving the specific value listed in Table 35-2 onto RXD<7:0>. See 36.2.5.2.3 for a description of the conditions under which a PHY will provide a False Carrier indication. Low power idle transitions are described in 35.2.2.9a.* describes two possible behaviors.

1. LPI rx, - 35.2.2.9a
2. False Carrier - 36.2.6.2.3

It's not clear which behavior has priority, and 35.2.2.9a does NOT indicate whether this only refers to .3az option -- "When the PHY receives signals from the link partner to indicate transition into the low power state it indicates this to the LPI client by asserting RX_ER and setting RXD<7:0> to 01 while keeping RX_DV deasserted."

Suggested Remedy

Should be TR but submitted after comment submission deadline.

Adopt Nomative Annex (or equivalent), or

Add optional implementation wording text in 35.2.2.7, or in 35.2.2.9a on LPI, and that if the option is not implemented, false carrier takes precedence (whereas if option is implemented, it is the other way around).

Proposed Response Response Status W PROPOSED ACCEPT IN PRINCIPLE.

The comment regarding priority makes no sense. There is no priority between different indications - if TXD<7:0> = 0x01 the indication is LPI; if TXD<7:0> = 0x0E the indication is false carrier; if TXD<7:0> = 0x0F the indication is carrier extend; if TXD<7:0> = 0x1F the indication is carrier extend error. Since the data bus cannot have multiple different values simultaneously, there is no prioritization specified - either for the existing or for the new indication.

It would be useful to add wording to 35.2.2.7a and 35.2.2.9a to highlight that the implementation is optional (even though no such wording exists for carrier extension that is similarly optional).

The first sentence for 35.2.2.7a and 35.2.2.9a becomes:

"The optional Low Power Idle operation and the LPI client are described in 78.1"
"The GMII may also support low power idle signaling as defined for Energy Efficient Ethernet in Clause 78 for certain PHY types."

Suggested Remedy

Per comment
PROPOSED ACCEPT.

"slightly" - how much is 'slightly'? Remove all such indefinite determiners from the text - they do not add anything to the description and may cause questions about the volume / quantity.

Suggested Remedy

Per comment

PROPOSED ACCEPT.

"The mapping is changed if the optional power idle (LPI) signaling is supported."

**Clock Stoppable**

Refer also to comment #6, rev 1.5

The clock stoppable bit as currently defined is not useful. It is better to split the control into two directions - PHY-MAC & MAC-PHY.

The MAC needs to assert a bit to allow the PHY to stop the clock in the PHY-MAC direction; The PHY needs to assert a bit to allow the MAC to stop the clock in the MAC-PHY direction.

**Suggested Remedy**

Change "Clock stoppable" to "Clock stop capable bit"

Also, change the reference to 45.2.3.2.2a and make it an active link.

**Proposed Response**

**Proposed Accept.**

---

**Comment Type**: TR/technical required  **Comment Status**: D

The words inserted into the first sentence of the second paragraph of this subclause are unnecessary. The subsequent paragraph describes the GMII RX signaling for LPI.

**Suggested Remedy**

Delete the words "or assert low power idle" on line 35, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

**Proposed Response**

**Proposed Accept in Principle.**

---

**Comment Type**: E  **Comment Status**: D

"de-assert' or 'deassert'? In various different locations, different spellings are used. Please confirm with 802.3 staff editors which version is the correct one and should be used. Scrub the draft.

**Suggested Remedy**

Per comment

**Proposed Response**

**Proposed Accept in Principle.**

Within clause 35, change all instances to de-assert.

---

**Comment Type**: T  **Comment Status**: D

"while driving the value <01> onto RXD<7:0>." how big is <01> ? If it is two bits long, how do to drive it into an 8-bit wide variable? If it is a hex representation, I think the correct way is to designate it as 0x01 to avoid confusion. What does it mean to 'drive' a value into something?

**Suggested Remedy**

Please clarify the issues

**Proposed Response**

**Proposed Accept in Principle.**

Change to 0x01

---

This content of this comment appears to be unrelated to the structure of the draft.
Rewrite the first paragraph of this section i.e. 35.2.2.9a since the language is very complex.
Proposed version: "When the PHY receives signals from the link partner indicating its transition into the low power state, it signals this fact to the LPI client by asserting RX ER and setting RXD<7:0> to 0x01 while keeping RX_DV deasserted. The PHY maintains these signals in this state while it remains in the Low Power Idle state. When the PHY receives signals from the link partner indicating its transition out of the low power idle state, it signals this fact to the LPI client by deasserting RX ER and returning to a normal inter-frame state."
Also, what is this 'normal inter-frame state'? 

Suggested Remedy:
Consider the proposal of the change plus answer the question

Proposed Response: PROPOSED ACCEPT IN PRINCIPLE.

Change to:

"When the PHY receives signals from the link partner indicating LPI, it signals this to the LPI client by asserting RX_ER and setting RXD<7:0> to 0x01 while keeping RX_DV deasserted. The PHY maintains these signals in this state while it remains in the Low Power Idle state. When the PHY receives signals from the link partner indicating its transition out of the low power idle state, it signals this fact to the LPI client by deasserting RX_ER and returning to normal inter-frame encoding."

"normal inter-frame" is defined in Table 35-2.

**Clock Stoppable**
Refer also to comment #6, rev 1.5
The clock stoppable bit as currently defined is not useful. It is better to split the control into two directions - PHY-MAC & MAC-PHY.
The MAC needs to assert a bit to allow the PHY to stop the clock in the PHY-MAC direction; The PHY needs to assert a bit to allow the MAC to stop the clock in the MAC-PHY direction

Suggested Remedy:
Change "Clock stoppable bit" to "Clock stop enable bit"
Also, make the reference an active link.

Proposed Response: PROPOSED ACCEPT.

What does the numeric value "0001" in the middle of Figure 35-9a indicate?
Is it supposed to be the value of the RXD<7:0> bundle? If so, it should be shown as a two digit hexadecimal number.

Suggested Remedy:
Change the value to 0x01 or simply 01, and then implement the Suggested Remedy in my general comment concerning the structure of the draft amendment.

Proposed Response: PROPOSED ACCEPT IN PRINCIPLE.

Change to 0x01.
The substance of this comment does not seem to be related to the document structure.

Law, David 3Com
Comment Type T Comment Status D
While there is a minimum of 9 RX_CLK clock cycles required on the entry to low power idle mode there is no specification of the minimum number of RX_CLK clock cycles required to exit low power idle mode although from the figure it could be implied that there is only one required.

Suggested Remedy
Add a specification of the minimum number of RX_CLK clock cycles required on exit from low power idle.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

While there is a minimum of 9 RX_CLK clock cycles required on the entry to low power idle mode there is no specification of the minimum number of RX_CLK clock cycles required to exit low power idle mode although from the figure it could be implied that there is only one required.

Suggested Remedy
Add a specification of the minimum number of RX_CLK clock cycles required on exit from low power idle.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

similar comment as 100M/s] It would be friendly to make LPI option status in PICS of Clause 35 (RS), Clause 36 (PCS), etc, to be consistent so that it is all or none, while not preventing systems (I don't know any good reason to though) to implement sub-layer by-sublayer option.

Suggested Remedy
Should be T but submitted after comment submission deadline.

No suggestions -- if deemed useful, please address it.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

The intent of the comment is not immediately apparent. Comments #38 & 36 adjust the PICS for clauses 35 and 36 to make them more consistent and convenient.

The general approach of 802.3 clause structures make "system wide" requirements or PICS entries difficult.

CI 35 SC 35.5.3.3a P 70 L 15 # 38
Barrass, Hugh Cisco
Comment Type T Comment Status D
Need separate PICS items for Rx & Tx direction LPI.

Suggested Remedy
Change L1:

Assertion of LPI in Tx direction : as defined in Table 35-1

Insert new item:

Assertion of LPI in Rx direction : as defined in Table 35-2

Proposed Response Response Status W

| 35 | Table 35-2 | ER | D | LATE | There are no accompanying specification text associated with "Assert low power idle" other than in clause 35.2.2.2.7 "While RX_DV is de-asserted, the PHY may indicate that it is receiving low power idle by asserting the RX_ER signal while driving the value <01> onto RXD<7:0>." Which is unclear - does it assert or not? Is it optional behavior, or is it required? 

Suggested Remedy

Should be ER but submitted after comment submission deadline.

Adopt Nomative Annex (or equivalent), or

Please clarify.

PROPOSED ACCEPT IN PRINCIPLE.

Comment #310 rewords the paragraph.

The words "Assert low power idle" may be found in Table 35-2 for a very clear and normative definition.

This comment is completely unrelated to the document structure, the suggested remedy to adopt a Nomative Annex is non sequitor.

---

<table>
<thead>
<tr>
<th>Cl</th>
<th>SC</th>
<th>Comment Type</th>
<th>Comment Status</th>
<th>Suggested Remedy</th>
</tr>
</thead>
</table>
| 36 | 2.5.1.3 | T | D | LATE | This note, along with RX state machine and Sync state machine, changes the legacy PHY, and makes legacy implementation not even referenceable once the new texts are all accepted.

'Add a note in 36.2.5.1.3 below the definition for "sync_status"

NOTE: If the optional low power idle function is implemented, then this variable is affected by the LPI receive state machine.'

sync_status in legacy is used in Synchronization Statemachine. In .3az, sync_status is used in receive statemachine. .3az Sync SS uses code_sync_status, with equivalent description as sync_status. After the .3az changes integrated it would read:

"sync_status
A parameter set by the PCS Synchronization process to reflect the status of the link as viewed by the receiver.
Values: FAIL: The receiver is not synchronized to code-group boundaries.
OK: The receiver is synchronized to code-group boundaries.
NOTE: If the optional low power idle function is implemented, then this variable is affected by the LPI receive state machine.

code_sync_status
Variable used by the synchronization state machine to indicate that receiver is synchronized to code-group boundaries.
Values: FAIL: The receiver is not synchronized to code-group boundaries.
OK: The receiver is synchronized to code-group boundaries."

We now have legacy PHY with no sync statemachine, since the variable sync_status does not exist in the RX SS, and where does code_sync_status come from?

Suggested Remedy

Should be TR but submitted after comment submission deadline.

Adopt Nomative Annex (or equivalent), or

Please clarify such that legacy PHY behaves as before, and .3az enhancement is compatible.

PROPOSED ACCEPT IN PRINCIPLE.

The comment appears to express some confusion over PHY behavior and specific variable names. The variable names are never part of the compliance requirement, only the externally visible behavior is normatively required.

In order to reduce confusion, change the note on p.72, l.3:
"NOTE: If the optional low power idle function is implemented, then this variable is affected by the LPI receive state machine. If the LPI function is not implemented then this variable is identical to code_sync_status controled by the synchronization state machine."

Comment Type ** State diagram conventions **

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

Suggested Remedy

Add a note:

Note: The state diagram conventions described in 36.1.7 apply to all of the state diagrams in this clause.

Proposed Response PROPOSED ACCEPT.

Comment Type E Comment Status D

"indicating "assert low power idle." - missing "" at the end. Additionally, wouldn't it be possible to say that GMII is singalling the request to assert the LPI?"

Gustlin, Mark Cisco

Comment Type T Comment Status D
The term broken seems strange in this statement:
The rx_wf_timer allows the receiver an additional period in which to synchronize or return to the quiescent state before the link is declared broken.

Should it be declared down or some other term?

Suggested Remedy
As above.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

There are three instances:
Clause 36, page 73
Clause 48, page 129
Clause 49, page 145

Change to
"...quiescent state before a link failure is indicated"
There is text in the figures that says that the items in the dotted boxes are new but nothing says that they are optional. It isn’t even clear whether the dotted boxes are intended to stay once this is integrated into 802.3 or are just to mark the new areas in the draft.

**Suggested Remedy**

New behaviors for EEE support must only be required when the EEE option is applicable to the PHY type and supported by the PHY. Put explicit text in that says that the states in the dotted boxes and transitions to and from them are required only for devices that support EEE.

Also, transitions to EEE states are only valid when EEE support is enabled. A PHY might support but be connected to a link partner that does not and in that case it should not exhibit any EEE behaviors. One clear way to do this would be to add an EEE enabled variable and condition any transitions to EEE states on this variable.

**Proposed Response**  
**Response Status:** W  
**PROPOSED ACCEPT IN PRINCIPLE.**

The change instruction identifies that the new states and transitions are in boxes. The boxes will therefore disappear at the next revision.

In most cases, the states and transitions required for optional behavior are not explicitly identified (e.g. CARRIER_EXTEND). It is left to the skill of the implementer to optimize away redundant structures.

However, to appease those who are especially nervous of EEE, add the following note:

**Note:** transitions B and C are required to support the optional LPI function.
This state machine has no change marks but it has been changed, at least in the variable name sync_status to code_sync_status.

It would be preferable to have different state diagrams for the new functionality minimize the risk of making changes in the required behavior for existing devices, but if this is not done, then all state machine changes must be marked.

**Proposed Remedy**

Mark all state machine changes so that they can be reviewed to ensure backwards compatibility with a reasonable amount of effort.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

See comment #37

New behavior should only apply when EEE operation is enabled, not when it is supported but disabled.

This also applies to 36.2.5.2.8.

**Proposed Remedy**

The TF did not deem it necessary to specify a "mode" for EEE because the standard precludes sending LPI unless it is supported by both link partners. This matches the treatment of other options within this clause (such as half-duplex, full-duplex and others).
### Proposed responses on D2

**Comment Type** TR  **Comment Status** D

In Figure 36-9b, transitions from RX_WAKE and RX_WTF to RXQUIET will restart quiet timer so realistic failure scenarios can cause undetected failure. One scenario is link partner driver failing or interconnect failure enough to attenuate but not kill the signal. Another is the Tx taps have changed.

Instead, the return transition should not restart quiet timer.

**Suggested Remedy**

Create new state RXQUIET_INIT between RX_SLEEP and RXQUIET. RX_SLEEP to RXQUIET_INIT when "signal_detect=FAIL".

RXQUIET_INIT to RXQUIET WHEN 'UCT'

In RXQUIET delete "Start rx_tq_timer".

In RXQUIET_INIT add "Start rx_tq_timer".

The above will permit the dead loop to continue until the quiet timer (3-4 ms) is done then a fault will be detected.

**Proposed Response** W  **Response Status** PROPOSED ACCEPT.

**Proposed Response** W  **Response Status** PROPOSED ACCEPT IN PRINCIPLE.

Add the comma and "s" as highlighted.

---

**Comment Type** TR  **Comment Status** D

Behavior changes for EEE behavior should only be exhibited when connected to an LP that also supports EEE.

**Suggested Remedy**

Through out the Clause, statements such as "When the PHY supports Energy Efficient Ethernet," or "When Energy Efficient Ethernet is <not> implemented" should be replaced with "When Energy Efficient Ethernet is <not> enabled"

In the case of the state machines, this might also be done with an EEE_enable variable that conditions going into LPI state and any other EEE behaviors.

**Proposed Response** W  **Response Status** PROPOSED REJECT.

This could be confusing, as terminology in Clause 78 is Low Power Idle mode A 1000BASE-T PHY may optionally enter a low power mode...

This was also found in Clause 55.

Suggested Remedy

change sentence to
A 1000BASE-T PHY may optionally enter a low power idle mode...

do global replace on low power mode to low power idle mode

Proposed Response: Response Status: W
PROPOSED ACCEPT IN PRINCIPLE.

To be consistent with the capitalization in Clause 78, the term "Low Power Idle mode" will replace the term "low power mode" when referring to Energy Efficient Ethernet.

Thaler, Pat
Broadcom

Comment Type: TR
Comment Status: D
This behavior should only be permitted when EEE mode is enabled preferably conditional on having negotiated EEE through AN.

Suggested Remedy

Begin the paragraph: "When EEE mode has been enabled, a 1000BASE-T PHY may ....

Proposed Response: Response Status: W
PROPOSED REJECT.

Refer to comment #423.

Hajduczenia, Marek
ZTE Corporation

Comment Type: T
Comment Status: D

Editorial comments for section 40.1.3.1

"When the PHY supports Energy Efficient Ethernet, the idle mode encoding conveys information to the remote PHY indicating whether the local PHY is requesting it to enter into the low power mode or not. Such requests are a direct translation of the assertion of low power idle at the GMII. In addition, the idle mode encoding conveys information to the remote PHY indicating whether the local PHY has completed the update of its receiver state or not, as indicated by the PMA PHY Control function"

Also some questions:
(1) what is "idle mode encoding"? is this like 'low power idle assertion'
(2) capitalization of terms like 'idle mode', 'low power idle' etc. needs to be scrutinized.

Suggested Remedy

Per comment

Proposed Response: Response Status: W
PROPOSED ACCEPT IN PRINCIPLE.

Refer to IEEE 802.3-2008, 40.1.3.1 (fourth paragraph) for the definition of "idle mode encoding".

"Between frames, a special subset of code-groups using only the symbols {2, 0, -2} is transmitted. This is called idle mode. Idle mode encoding takes into account the information of whether the local PHY is operating reliably or not (see 40.4.2.4) and allows this information to be conveyed to the remote station. During normal operation, idle mode is followed by a data mode that begins with a Start-of-Stream delimiter."

Usage of the term, including capitalization, is consistent with the base document. However, in the process of reviewing this comment, a different issue with terminology was noted and will be corrected.

Change text:
"Such requests are a direct translation of the assertion of low power idle at the GMII."

To:
"Such requests are a direct translation of "assert low power idle" at the GMII."
The second note to Fig 40-3 reads:

NOTE - Signals and functions shown with dashed lines are optional.

are these dashed lines associated with low power idle mode?
are these lines mandatory if the optional mode is supported?

Suggested Remedy

Change note to read:

NOTE - If optional Low Power Idle mode is supported, signals and functions shown with dashed lines are mandatory.

PROPOSED ACCEPT IN PRINCIPLE.

All signals and functions shown with dashed lines are associated with Energy Efficient Ethernet.

Change second note in Figures 40-3 and 40-14 and the note in Figure 40-5 to read:

"Signals and functions shown with dashed lines are only required for the optional Low Power Idle mode."

Change the note in Figure 40-4 to read:

"Service interface primitives shown with dashed lines are only required for the optional Low Power Idle mode."

<td>Changes for EEE should only be added in a way that makes it clear what non-EEE devices are required to support. Equations that apply to non-EEE devices should not be changed.</td>
<td>PROPOSED ACCEPT IN PRINCIPLE. If the document is restructured so that functions related to the optional low power idle mode are moved to an annex or a separate clause, this comment will be overtaken by events. If the document is not restructured, then a separate set of equations should not be necessary. When the optional Low Power Idle mode is not implemented, or requested by the LPI client (e.g. &quot;assert low power idle&quot; is not present at the GMII), the behavior of the PHY, including the equations of 40.3.1.3.4, is intended to revert to the original behavior. The variable loc_lpi_req is FALSE when &quot;assert low port idle&quot; is not present at the GMII per Figure 40-9. When the optional low power idle mode is not implemented, loc_lpi_req required to assume the value of FALSE per 40.3.1.3.4. The equation for Sdn[3] reverts to its original form when loc_lpi_req = FALSE. The equation of Sdn[2] adds a term &quot;and (tx_mode != SEND-Z)&quot; which is a redundant term for a non-EEE 1000BASE-T implementation and has no impact on externally observable behavior. If loc_lpi_req = FALSE, then loc_update_done must be FALSE per Figure 40-15 (see also 40.4.5.1) and the equation for Sdn[1] reverts to its original form. The equation for cext_err adds the term &quot;and (TXDn[7:0] != 0x01)&quot; which does modify the externally observed behavior of a 1000BASE-T PHY. However, this change impacts how the PHY responds to the presence of a reserved code (for non-EEE implementations) at the GMII. This discrepancy may have little practical impact, but may be removed by: a) Creating separate versions of this specific equation for the non-EEE and EEE cases or... b) Replacing the term &quot;and (TXDn[7:0] != 0x01)&quot; with &quot;and (loc_lpi_req = FALSE)&quot; which realizes the same Low Power Idle mode behavior but also causes the equation to revert to its original form when Low Power Idle mode is not engaged or implemented.</td>
</tr>
</tbody>
</table>
**State diagram conventions**

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

**Suggested Remedy**

Add a note:

Note: The state diagram conventions described in 40.1.6 apply to all of the state diagrams in this clause.

**Proposed Response**

PROPOSED REJECT.

40.6.1 in the base document already states that "The notation used in the state diagrams follows the conventions of 21.5." and the proposed note appears to be redundant.

**Proposed Response**

PROPOSED ACCEPT.

"Condition "(Rxn) ? IDLE) * (rem_lpi_req = TRUE + lpi_mode = ON)" is located a little bit too much to the left and it does not seem to apply to the transition between IDLE and LP_IDLE states.

**Suggested Remedy**

Move it to the right, please.

**Proposed Response**

PROPOSED ACCEPT.

"When the PHY supports Energy Efficient Ethernet, PHY Control will transition to a low power mode in response to concurrent requests for low power operation from the local PHY (loc_lpi_req = TRUE) and remote PHY (rem_lpi_req = TRUE)." - how do you guarantee that the remote and local PHYS transit to the lower power idle mode at the same moment of time? There is something like transmission delay in P2P links which will make it impossible. Could you clarify this concept in the draft?

**Suggested Remedy**

Per comment.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

When the system requests operation in Low Power Idle mode, "assert low power idle" is continuously encoded at the GMII. Per the PCS Local LPI Request state diagram (Figure 40-9), loc_lpi_req = TRUE is continuously encoded in the transmitted symbols when "assert low power idle" is present on the GMII. This implies that rem_lpi_req = TRUE will be continuously decoded from the received symbols by the link partner. Since this is not a "one time" transmission, but rather a continuous encoding of state, the synchronization issue implied by the commentor does not exist.

If rem_lpi_req = TRUE is not decoded from the received symbols while "assert low power idle" is present at the GMII (or vice versa), then the intended behavior is to not have the PHY transition to Low Power Idle mode.

The draft adequately describes the intended behavior and no further clarification is required.
"Note that when the PHY supports Energy Efficient Ethernet, when signal_detect is FALSE, scr_status is set to NOT_OK" - this sentence does not read right. There are two "when" conditions? Perhaps one should be changed to an "if" condition. Are the conditions mutual?

**Suggested Remedy**
Please rewrite this sentence so that it is clear what it means. Avoid using two 'when' statements unless used together with 'and/or' e.g. `... when ... and when ...` or alike.

**Proposed Response**

Proposed ACCEPT IN PRINCIPLE.

"Note that when the PHY supports Energy Efficient Ethernet and signal_detect is FALSE, scr_status is set to NOT_OK."

**Comment Type:** E  
**Comment Status:** D

"or not the remote PHY is has completed the" - either 'is' or 'has'

**Suggested Remedy**

Per comment

**Proposed Response**

Proposed ACCEPT IN PRINCIPLE.

".the remote PHY has completed."

**Comment Type:** E  
**Comment Status:** D

This timer defines the maximum time the PHY will dwell in the POST_UPDATE state before... This timer defines the maximum time the PHY will remain quiet before initiating transmission to... etc. in the same section. 
It would be more natural to use "...PHY dwells... / ...PHY remains..." etc. Avoid using Future Simple since it does not relay the idea that such an operation of the underlyign function/element is certain

**Suggested Remedy**

Per comment

**Proposed Response**

Proposed ACCEPT IN PRINCIPLE.

Modify timer definitions in 40.4.5.2 to avoid the use of the future simple tense.
There is a corner case inside the state diagram of Figure 40-15b in the outbound transitions from UPDATE. The main reason for this corner case is the asynchronous behavior of the state-machine but the synchronous transfer (symbol-period) of the inband control signals like loc_lpi_req, loc_update_done, loc_rcvr_status. This implies that signals may be received in parallel, e.g. rem_update_done=true and rem_lpi_req=false when in POST_UPDATE state. This, however, is assumed by the current version of the state machine not to occur.

Here’s the description of the corner case:
The Slave transitions into POST_UPDATE due to timeout of lpi_update_timer. The Master is assumed to stay in UPDATE and it’s loc_lpi_req stays true the whole time. When the Slave enters POST_UPDATE is will send it’s loc_update_done to the MASTER. Assume that loc_lpi_req gets deasserted at the Slave shortly (<8ns) after entering into POST_UPDATE. This will cause a signaling of loc_lpi_req on the line to the MASTER. Now, by nature of the inband signaling both loc_update_done=true and loc_lpi_req=false of the Slave are synchronized to the same symbol period and transferred synchronously to the Master. As such the Master receives both signals simultaneously. By current implementation the Master will take it’s way back to IDLE because rem_lpi_req=false, although rem_update_done=true. This causes a problem to the Master since the Slave will do it’s normal wake cycle via WAKE_SILENT, QUIET, WAKE and TRAINING. However, when the Slave enters QUIET it will stop signaling to the Master. As such the Master will break the link.

A better introduction into this corner case is handled in the presentation traeb_01_0909.pdf

Suggested Remedy
Change the outbound state transitions in UPDATE state as follows:

UPDATE->POST_UPDATE:  
(rem_update_done=TRUE + lpi_update_timer_done) * (loc_lpi_req=TRUE)

UPDATE->IDLE:  
loc_lpi_req=FALSE + (rem_lpi_req=FALSE * rem_update_done=FALSE)

This will cause the link-partners to follow via the POST_UPDATE when at least one side of the link entered this state before.
Since clause 40 Next-Pages became mandatory. Within clause 40 (Annex40C) the ordering of the Next-Pages have been defined. Within clause 40 (Annex40C) the mandatory clause 40 relevant Next-Pages must be sent autonomously. In the current Draft 2.0 additional Next-Pages have been defined to advertise the EEE features. However, it is not yet defined in which order they must be sent in addition to the existing PHY Next-Pages. Especially legacy PHYs like 100base-TX did not require any Next-Pages up to now which will change. Existing tests will fail (see also UNH ANEG Test-Suite).

More details in traeber_02_0909.pdf

Suggested Remedy
(1) Define a sequence ordering of the exchanged Next-Pages which is mandatory
(2) Define that these pages are sent autonomously before the SW Next-Pages

Change the Standard Draft:
(A) Include EEE MP and EEE UP into Figure 40C-2
(B) Include EEE MP and EEE UP into Figure 40C-3
(C) Add and Annex 25A which describes the clause 25 Next-Page ordering/autonomous for EEE pages similar to Annex 40C
(D) The concept shall be applied similarly to Extended Next-Pages, e.g. 10GbT

The proposed changes (C) and (D) are beyond the scope of Annex 40C and should be discussed by the Task Force.

Delete the text here, move to a table in 55.6.

Also: Do we need to advertise backplane PHY EEE capability in these bits?

Suggested Remedy
Delete the text here, move to a table in 55.6.

[Alternatively, we can use a new extended next page, but this will increase startup time (by~1/4 second?)]

Definition of bits in extended next page can be added in 55.6 (Table 55-11).
Add a column for extended next page bit numbers in table 45-145 - note that comment #415 is adding the unformatted next page bit numbers.
Change the text of 45.2.7.13a:
This register defines the EEE advertisement that is sent in the unformatted next page following a EEE technology message code as defined in 28C.12 or in 73A.4. For PHYs that negotiate extended next page the EEE advertisement is sent as part of the 10GBASE-T/1000BASE-T technology message defined in 55.6.1. The assignment of bits in the EEE advertisement register is shown in Table 45-145.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.
See comment #39

Cl 45 SC 45.2.3
Ganga, Ilango
Intel
Comment Type ER Comment Status D
The table 45-83 and other tables in Clause 45 have been modified by P802.3ba. So the editing instructions should include the appropriate source document where the source is other than IEEE Std 802.3-2008. Also the table numbers should be changed to indicate the latest renumbered table numbers from previous amendment(s).
Also other PCS registers have been modified by the P802.3ba document (or other amendments e.g. P802.3ave). So update the editing instructions and the change text as per the draft P802.3ba/D2.2.
For example change editing instruction as follows:
45.2.3.1 PCS control 1 register
Change Table 45-83 (IEEE P802.3ba/D2.2) for LPI clock control:
Update the table such that the base text is from the above source.
Suggested Remedy
Update the Editing instructions and Table numbers to indicate appropriate source for base text and use the renumbered table number from appropriate amendment to 802.3-2008. Also update the base text as appropriate as per the source document (for example IEEE P802.3ba/D2.2).
Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.
See comments #39, 40, 41, 42, 43
Proposed responses on D2

Implement clock stoppable changes that were agreed upon at July Plenary.

Suggested Remedy

Define bit 3.0.10 to enable the PHY to stop the receive clock. Appropriately change Table 45-2 and 45.2.3.1.3a with the new definition.

Allocate an existing reserved status bit and appropriately define it to indicate whether the PHY is capable of handling a stopped transmit clock. Change the appropriate Table entry for this bit and add a new section describing this bit. In this new section explicitly define the behavior of the PHY if it does not support LPI or is not able to handle the MAC/LPI Client stopping the xMII clock with the following sentence:

"If the PHY does not support low power idle signaling or is not able to handle a stopped transmit xMII clock, then it shall clear this bit to 0."

Related to the two newly-defined bits, corresponding changes are needed in the following places in the draft: 22.2.2.9a, Table 40-3, 35.2.2.6a, 35.2.2.9a, 46.3.1.5a, and 46.3.2.4a.

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

See comments #48, 49

Comment Type: T  Comment Status: D

**Clock Stoppable**

Refer also to comment #6, rev 1.5

The clock stoppable bit as currently defined is not useful. It is better to split the control into two directions - PHY-MAC & MAC-PHY.

The MAC needs to assert a bit to allow the PHY to stop the clock in the PHY-MAC direction. The PHY needs to assert a bit to allow the MAC to stop the clock in the MAC-PHY direction.

Suggested Remedy

Change register bit 3.0.10 to:

Clock stop enable : 1 = PHY may stop the clock during LPI, 0 = clock not stoppable.

Change the text of 45.2.3.1.3a:

If bit 3.0.10 is set to 1 then the PHY may stop the receive xMII clock while it is signaling low power idle otherwise it shall keep the clock active. If the PHY does not support low power idle signaling or is not able to stop the receive clock then this bit has no effect (see 22.2.2.9a, 35.2.2.9a, 46.3.2.4a).

Proposed Response

PROPOSED ACCEPT.

<td>D</td>
<td>There is no reason to send EEE capabilities for backplane PHYs when using Clause 28 auto-neg or for BASE-T PHYs when using Clause 73 auto-neg. They two classes of PHYs use different auto-negotiation. Also, Clause 73 next pages are always equivalent to Clause 28 extended next pages. Therefore &quot;For PHYs that negotiate extended next page support doesn't apply to them&quot; so you need to add text to cover Clause 73 auto neg. Since backplane phys have 32 U bits in a message there is no reason to restrict it to 11 bits. And with higher speeds coming out there may be enough new Clause 73 auto-neg PHYs to need more bits. If any additional BASE-T PHYs are defined they are also likely to require extended next pages as 10GBase-T did and have 32 bits available.</td>
</tr>
<tr>
<td>T</td>
<td>D</td>
<td>Define the mapping at least for 16 bits for extended next pages and Clause 73. Consider specifying just sending the relevant bits for the auto-neg type allowing the bit usage to overlap for the two auto-neg types.</td>

<tr>
<td>TR</td>
<td>D</td>
<td>These additions to the PICS make every existing PCS, even PCS types don’t have the option to support EEE, and Clause 45 AN implementation non-compliant. There is no reason to make these registers mandatory for devices that don’t support EEE. 45.2 already documents the behavior when registers that the device doesn’t support are accessed and that requirement is enough to provide backwards compatibility for management that doesn’t know whether a device supports EEE. Also the PCS items need to be conditional on PCS.</td>
</tr>
</tbody>
</table>

### Proposed Response

**Response Status:** W

**PROPOSED ACCEPT IN PRINCIPLE.**

The additional column is defined for bit mapping. BASE-T capabilities are only sent in Clause 28 or 55 defined frames; BASE-K capabilities are only sent in Clause 73 defined frames. Define the mapping for all 16 bits. Do not use overlap.

The TF may discuss using separate registers for clause 28 and clause 73 autoneg.

<td>No behavior changes should be exhibited between an EEE supporting device and a non-EEE supporting device. This note implies a new requirement for all Reconciliation sublayers to support a clock that may be halted.</td>
<td>PROPOSED REJECT.</td>
</tr>
</tbody>
</table>

**Suggested Remedy**

1. Add the text: "The definition of low power idle signaling assumes the use of the MAC defined in Annex 4A for simplified full duplex operation (with carrier sense deferral). This provides full duplex operation but uses the carrier sense signal to defer transmission when the PHY is in low power idle state."

2. Add equivalents to subclause 22.7a through 22.7a.3.1 for the XGMII to the changes to Clause 46. Another idea may be to add much of 22.7.a, changed to be non-interface specific, to 78.1.3 to apply to all xMII.

**Proposed Response**

**Proposed Accept**

- Add the text as proposed in [1].
- Add a new subclause equivalent (and almost identical) to 22.7a through 22.7a.3.1.

**Proposed Response**

**Proposed Accept**

- Is this really 'Normal inter-frame'?

**Suggested Remedy**

Suggest that 'Normal inter-frame' be changed to read 'Low power inter-frame'.

**Proposed Response**

**Proposed Reject.**

There is no "low power" behavior defined for PLS_DATA.request, therefore the mapping should be "normal inter-frame" for both IDLE and LPIDLE.
### Proposed responses on D2

**IEEE P802.3az D2.0 Energy Efficient Ethernet comments**

**Proposed response on D2**

**Comment**

This requirement is stated such that it applies to all PHYs - even those with PMDs that don’t support low power idle. EEE requirements should only apply to those PHYs where it is applicable and supported.

**Suggested Remedy**

Make it clear in the table that the new code should only be sent when EEE is supported and enabled and that reception of the code is only required in that case. Also make the new sentence only applicable when EEE is supported and enabled.

Ensure that through out the clause that new requirements are not placed on non-EEE devices and that EEE supporting devices are only to exhibit new behavior to peers or across the XGMII when EEE mode is enabled with EEE supporting partners.

**Proposed Response**

**Response Status** W

PROPOSED ACCEPT IN PRINCIPLE.

Change the sentence:

"A PHY that supports the optional LPI function shall interpret the combination of TXC and TXD as shown in Table 46-3 as an assertion of low power idle."

---

**Comment**

**Clock Stoppable**

Refer also to comment #6, rev 1.5

The clock stoppable bit as currently defined is not useful. It is better to split the control into two directions - PHY-MAC & MAC-PHY.

The MAC needs to assert a bit to allow the PHY to stop the clock in the PHY-MAC direction; The PHY needs to assert a bit to allow the MAC to stop the clock in the MAC-PHY direction.

**Suggested Remedy**

Change "clock stoppable bit" to "Clock stop enable bit"

Also, change the reference to 45.2.3.2.a.

PROPOSED ACCEPT.
The variables, counters and messages have been added with no indication that they only need to be supported devices that support EEE.

**Suggested Remedy**
Either group all the variables, counters and messages required for EEE operation only in a separate subclause or indicate in the description of each one that it only applies when EEE is supported.

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Change the note on p.128, l.49 can be changed in a similar manner to comment #483 response:

"**NOTE:** If the optional low power idle function is implemented, then this variable is affected by the LPI receive state diagram. If the LPI function is not implemented then this variable is identical to deskew_align_status controled by the deskew state diagram.

There is no necessity to group, or otherwise modify the descriptions for variables etc. that are associated with options. It is assumed that any competent designer (or synthesis tool) will be able to remove redundant hardware for options that are not required (the same reasoning as for comment #419)."

---

Most of the new definitions are for timers not counters.

**Suggested Remedy**
Create a subclause for timers.

**Proposed Response**

PROPOSED ACCEPT.
It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

### Proposed Remedy

Add a note:

Note: The state diagram conventions described in 48.2.6 apply to all of the state diagrams in this clause.

**Proposed Response**

**Response Status** W

**PROPOSED ACCEPT.**

### Proposed Remedy

One approach would be to modify the definitions for the constants ||R|| and ||K|| to state that if TX=||LPIDLE||, one code-group of the column is replaced by /D20.5/ as defined in 48.2.4.2. Or create two new constants to represent the LP Idle versions of ||R|| and ||K|| and in the state boxes use an if TX=||LPIDLE|| to send the correct constant.

**Proposed Response**

**Response Status** W

**PROPOSED ACCEPT IN PRINCIPLE.**

Modify the definitions of ||R|| and ||K|| to state that if the optional LPI function is supported then one lane (randomly selected) is replaced by /D20.5/ during ||LPIDLE|| as defined in 48.2.4.2.

PROPOSED ACCEPT.
RX_SLEEP: The rx_tq_timer that is started in this state is defined in 48.2.4.2.5 to be started when the RX_QUIET state is entered not the RX_SLEEP state. Also, the ||LPIDLE|| exit condition from this state that goes back to this state and will cause the timer to be restarted upon each re-entry.

RX_WAKE: The signal_detect=FAIL exit condition does not seem appropriate because it allows the device to receive data or other non-Idle and non-LPIDLE characters while in the RX_WAKE state while signal_detect=OK, only LPIDLE should be received.

Suggested Remedy
- RX_SLEEP: If a timer is intended to be utilized in this state then a rx_ts_timer should be defined.
- RX_WAKE: Remove the signal_detect=FAIL exit condition.

PROPOSED ACCEPT IN PRINCIPLE.

The state machine is modified by comment #98. Update the description in 48.2.4.2.5 to match the modified state machine.

Thaler, Pat
Broadcom

There appears to be a small bug in the state machine. If while in LPI, the link becomes degraded such that the receiver can not acquire deskew_align_status=OK, but the signal is still able to trigger signal_detect=OK though perhaps sluggishly or intermittently, then Link Failure will not be detected.

Also note that at these speeds, signal detect is difficult and it is possible that noise on a none terminated line may cause signal detection. It is so difficult at these speeds to set a threshold that doesn't unsquelch for noise and does for signal that we made it optional in Clause 71 and rely mainly on gaining alignment as a measure of link quality.

Each time LPI is sent on the link, signal detect (which might be due to noise) will cause a transition from quiet to wake. If alignment cannot be achieved by the time the incoming signal returns to quiet, the state returns to quiet and the rx_tq_timer is restarted. This can go on indefinitely without detecting the failure because none of the timers time out.

This may delay failure detection or prevent it which hurts fast fail-over capabilities in end nodes and bridges. Also, if the machine doesn't get to RX_LINK_FAIL to assert align_status = FAIL, auto-neg to begin to restore the link can not start.

Suggested Remedy
- Start rx_tq_timer only in RX_SLEEP state so that cycles of signal detect that don't achieve alignment don't restart the timer.
- Also, the definition of rx_tq_timer currently says that it is started in RX_QUIET but doesn't mention that it is also started in RX_SLEEP. Correct the definition to match the resolution of this comment.

PROPOSED ACCEPT IN PRINCIPLE.

Detailed resolution in comment #98

Estes, Dave
UNH - IOL
Proposed responses on D2

Brown, Matt
AppliedMicro (AMCC)

Comment Type: TR  Comment Status: D

Transitions from RX_WAKE and RX_WTF to RX QUIET will restart quiet timer so realistic
failure scenarios can cause undetected failure. One scenario is link partner driver failing or
interconnect failure enough to attenuate but not kill the signal.

Instead, the return transition should not restart quiet timer.

SuggestedRemedy

Create new state RX QUIET_INIT between RX_SLEEP and RX QUIET.
RX_SLEEP to RX QUIET_INIT when "signal_dect=FAIL",
RX QUIET_INIT to RX QUIET WHEN "UCT"
In RX QUIET delete "Start rx_tq_timer".
In RX QUIET_INIT add "Start rx_tq_timer".

The above will permit the dead loop to continue until the quiet timer (3-4 ms) is done then a
fault will be detected.

Need more specific PICs items for state machines

SuggestedRemedy

Replace item LP-01 with:

LP-01 - receive state machine: Support additions to Figure 48-9 for LPI operation: 48.2.6.2
LP-02 - LPI transmit state machine: Meets the requirements of Figure 48-9a: 48.2.6.2.5
LP-03 - LPI receive state machine: Meets the requirements of Figure 48-9b: 48.2.6.2.5
LP-04 - LPI transmit timing: Meets the requirements of Table 48-9: 48.2.6.2.5
LP-05 - LPI receive timing: Meets the requirements of Table 48-10: 48.2.6.2.5

Proposed Response  Response Status: W

PROPOSED ACCEPT.
This statement is confusing:

If the optional Low Power Idle function is implemented the transmit and receive functions are modified as shown in Figures 49-16 and 49-17.

The transmit and receive functions are specified by 49-14 and 49-15, clarify this statement.

As above.

PROPOSED ACCEPT IN PRINCIPLE.

This clause is not consistent with what it calls the low power option. Here is is Energy Efficient Ethernet, elsewhere it is called Low power idle. I think it would be good to be consistent, stick with one or the other when calling out the optional functions.

As above.

PROPOSED ACCEPT IN PRINCIPLE.

Change "Energy Efficient Ethernet" to "LPI" to be consistent with other subclauses.

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

Add a note:

Note: The state diagram conventions described in 49.2.13.1 apply to all of the state diagrams in this clause.

Similarly to comment #394

Change the note on p.144, l.13 can be changed in a similar manner to comment #483 response:

"NOTE: If the optional low power idle function is implemented, then this variable is affected by the LPI receive state diagram. If the LPI function is not implemented then this variable is identical to rx_block_lock controlled by the lock state diagram."

There is no necessity to group, or otherwise modify the descriptions for variables etc. that are associated with options. It is assumed that any competent designer (or synthesis tool) will be able to remove redundant hardware for options that are not required (the same reasoning as for comment #419).

Proposed Response  W
PROPOSED ACCEPT.

Comment Type  T  Comment Status  D
Comment: R_BLOCK_TYPE

Type C currently states "A block type field of 0x1e and eight valid control characters none of which is /E/ and all eight of which are not /LI/ (note that the eight /LI/ characters are only excluded if the optional Low Power Idle function is supported)." The wording "none of which is /E/ and all eight of which are not /LI/" is confusing and can be mis-interpreted (does all eight of which are not /LI/ mean that none are /LI/ or less than 8 are /LI/?). The note "note that the eight /LI/ characters are only excluded if the optional Low Power Idle function is supported" is not necessary because page 138 lines 53/54 states that if the Low Power Idle function is not supported then Low Power Idle characters will be treated as an error if received.

Suggested Remedy
Change bullet a) of Type C from "A block type field of 0x1e and eight valid control characters none of which is /E/ and all eight of which are not /LI/ (note that the eight /LI/ characters are only excluded if the optional Low Power Idle function is supported)" to "A block type field of 0x1e and eight valid control characters other than /E/ and where less than eight of the characters are /LI/".

Proposed Response  W
PROPOSED ACCEPT IN PRINCIPLE:
Make the change suggested, but change:
"and where less than eight of the characters are /LI/"
"and, if the optional LPI function is supported, less than eight of the characters are /LI/"
(see comment #452)
Something beginning "note that" isn't normative and bit errors could create an LI on a non-LPI link. We shouldn't place new requirements on a currently conformant device.

Suggested Remedy

- replace from "and" with "and, when EEE is enabled, all eight of which are not /LI/"
- Also For "LI:" supported should be enabled.

This comment also applies to T_BLOCK_TYPE

Proposed Response

- Delete the note & make LPI support statement normative as suggested - see comments #131, 132 for details.

See response to comment #402 for supported vs enabled.
This statement is confusing:

"Change Figure 49-14 for LPI transmit state diagram and 49-15 for LPI receive state diagram" Does it refer to the transmit state diagram (49-14) and receive (49-15), or the LPI transmit state diagram (49-16) and the LPI receive state diagram (49-17)?

Suggested Remedy

Clarify the statement accordingly.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Comment #455 clarifies.

Comment Status D

Figure 49-15

RX_D: There is not an exit condition defined if R_TYPE_NEXT=LI.

RX_E: There is not an exit condition defined if R_TYPE_NEXT=LI.

Suggested Remedy

RX_D: Modify the exit conditions from RX_D and RX_E states to the RX_T state to "R_TYPE(rx_coded)=T * R_TYPE_NEXT=(S+C+LI)"

Proposed Response Response Status W

PROPOSED ACCEPT.

---

Comment Type TR

Comment Status D

This state diagram also needs a note saying the state in the dotted box is optional.

Suggested Remedy

In most cases, the states and transitions required for optional behavior are not explicitly identified (e.g. CARRIER_EXTEND). It is left to the skill of the implementer to optimize away redundant structures.

However, to appease those who are especially nervous of EEE, add the following note:

Note: transition E is only required to support the optional LPI function.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE: Comment #455 may satisfy this.
There appears to be a small bug in the state machine. If while in LPI, the link becomes degraded such that the receiver can not acquire rx_block_lock, but the signal is still able to trigger energy_detect=OK though perhaps sluggishly or intermittently, then Link Failure will not be detected.

Also note that at these speeds, signal detect is difficult and it is possible that noise on a none terminated line may cause signal detection. It is so difficult at these speeds to set a threshold that doesn't unsquelch for noise and does for signal that we made it optional in Clause 72 and rely mainly on gaining alignment as a measure of link quality.

Each time LPI is sent on the link, energy_detect (which might be due to noise) will cause a transition from quiet to wake. If block lock cannot be acheived by the time the incoming signal returns to quiet, the state returns to quiet and the rx_tq_timer is restarted. This can go on indefinitely without detecting the failure because none of the timers time out.

This may delay failure detection or prevent it which hurts fast fail-over capabilities in end nodes and bridges. Also, if the machine doesn't get to RX_LINK_FAIL to assert block_lock = FAIL, triggering auto-neg to begin to restore the link can not start.

Suggested Remedy
Start rx_tq_timer only in RX_SLEEP state so that cycles of signal detect that don't achieve alignment don't restart the timer.

Also, the definition of rx_tq_timer currently says that it is started in RX_QUIET but doesn't mention that it is also started in RX_SLEEP. Correct the definition to match the resolution of this comment.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Because signal_ok requires a recovered clock and energy_detect only requires energy on the line, there is an alternate solution:

Change transition from RX_QUIET to RX_WAKE to "signal_ok"

Thus, the signal must be good enough for a clock to be recovered in order to enter RX_WAKE but must lack enough energy to trigger energy_detect to return to RX_QUIET.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Because signal_ok requires a recovered clock and energy_detect only requires energy on the line, there is an alternate solution:

Change transition from RX_QUIET to RX_WAKE to "signal_ok"

The transmitter timers should also specify the acceptable range - either by min and max columns as for the receivers or by stating a tolerance.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

Add a column "Min" use "5" "1.6" "1.6" and "11" for rows 1, 2, 3, 4 respectively.

Proposed Response
PROPOSED ACCEPT IN PRINCIPLE.

</thead>
<tbody>
<tr>
<td>49</td>
<td>49.2.6</td>
<td>TR</td>
<td>D</td>
<td>This says that holding the scrambler reset aids in block synchronization. Apparently this only applies to FEC block synchronization. The 64B/66B block lock state machine will not obtain lock with the scrambler off because it relies on the scrambler running to ensure that the only spot in a block where a persistent transition occurs is at the sync header. If the scrambler is held reset for 1 us, then the clock state machine can have an incorrect lock until it is released.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>There is no statement made of when scrambler reset should/may/shall be enabled. The simplest approach is to require scrambler_reset_enable to be true when the PHY has FEC and false otherwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If use of scramble reset is optional outside FEC or not mandatory for FEC, then it would have to be negotiated.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Suggested Remedy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Add the requirements for when scrambler_reset_enable shall be true when FEC is operating and false otherwise. Also, change the description to say that it aids in FEC block synchronization.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Also, once signal detect indicates okay because of FEC lock and unscrambled data is arriving, the R PCS may think it has block lock because it can lock on any transition in the unscrambled data but it won't be producing usable receive data since it may have a bad lock and even if it happened to lock on the sync header, its descrambler is running even though the incoming 64B/66B blocks are not scrambled. Explain how that is to be handled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If there is an intent for scrambler reset to be used outside FEC, then the mechanism for block lock will need to be specified/explained and enabling of scrambler reset will need to be added to clause 45 and auto-neg. Also, how the receiver knows when to enable its descrambler will need to be explained unless the assumption is that it is okay to get bad blocks out of the 64B/66B from the time that lock occurs until the input data is scrambled.</td>

IEEE P802.3az D2.0 Energy Efficient Ethernet comments

September 2009

Cl  55  SC 55.3.2.2.9a  P 163  L 40  # 194
Grimwood, Michael  Broadcom

Comment Type  T  Comment Status  D
The specification is not explicit with respect to how /LI/ characters are treated when low-power idle is not supported.
This leads to ambiguity in Section 55.3.5.2.4 (pp 170-171) with respect to whether R_BLOCK_TYPE and T_BLOCK_TYPE are of type C or E when low power idle is not supported and one or more /LI/ characters are present.

Suggested Remedy
Add the following sentence to the end of the paragraph:
If low power idle is not supported, then /LI/ is not a valid control character.

Proposed Response  Response Status  W
PROPOSED ACCEPT.

Cl  55  SC 55.3.2.2.9a  P 165  L 33  # 75
Brown, Matt  AppliedMicro (AMCC)

Comment Type  E  Comment Status  D
Definition incorrectly describes the criteria by which /LI/ characters indicate when to enter low power mode. This is described in 55.1.3.3 as indicated later in the paragraph.

Suggested Remedy
In first sentence of paragraph, remove: "When preceded by control characters /I/, " and capitalize first letter of "low".

Proposed Response  Response Status  W
PROPOSED ACCEPT.

- Equations for REFRESH_A/B/C/D is hard to read and somewhat ambiguous.
  
  **Suggested Remedy**
  - Put brackets around "rx_active_pair==PAIR_A/B/C/D".
  - State that result of equation must be true.
  - Put equation on new line

  **Example:**
  
  The variable is set to REFRESH_A when 
  \[(tx_lpi_active \times (tx_active_pair==PAIR_A) \times tx_{refresh\_active})\]
  is TRUE.

**Proposed Response**

- **Proposed Accept.**
Bullet a) of Type C currently states "A block_type field of 0x1E and eight valid control characters, none of which are /E/ and, if the low power idle function is supported, all of which are not /LI/ ". The wording "all of which are not /LI/" is confusing and can be misinterpreted (does all of which are not /LI/ mean that none are /LI/ or less than 8 are /LI/?).

The I type should be it's own type and not a subset of C type, so this will need to be reflected in the C type definition.

**Suggested Remedy**

Change bullet a) of Type C to "A block_type field of 0x1E and eight valid control characters other than /E/ and, if the low power idle function is supported, less than eight of the characters are /LI/ and less than eight of the characters are /I/".

Change the definition for type I to remove the references to this type being a subcause of type C.

**Proposed Response**  
**Response Status** W

PROPOSED REJECT.

It is not desirable to separate C/I; if this is done then we break the state machine for existing 10GBASE-T PHYs, for which C includes I. Fixing this would complicate the existing state machine substantially.

The wording will be changed to "A block_type field of 0x1E and eight valid control characters, none of which are /E/ and, if the low power idle function is supported, none of which are /LI/ ".

If we choose to separate the text for EEE and non-EEE operation then this proposal should be adopted.

---

**Comment Type** T

State diagram conventions

It is not clear which state diagram conventions are relevant for each section in this amendment. Notes need to be added so that the conventions for each clause are clear.

The conventions may be cleaned up and coordinated in the next revision when all clauses are open.

Suggested Remedy

Add a note:

Note: The state diagram conventions described in 55.1.6 apply to all of the state diagrams in this clause.

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

The changes for EEE are governed by the state diagram conventions described in 55.1.6.

---

Cl 55 SC 55.3.5.4 P173 L #142
Estes, Dave UNH - IOL

Comment Type: T, Comment Status: D

Terminate state transitions

Figure 55-15: In Clause 49 it is valid to transmit LI while exiting the TX_T state, however this is not shown as a valid transition in Clause 55.

Suggested Remedy

Add an exit condition from TX_T to TX_L if T_TYPE(tx_raw)=LI, and remove type LI in the transition to the TX_E state.

Proposed Response

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.
LI is specified as including case with either 8/L/I/ or 4x/L/I/+4x/L/I/.
As the state machine in Figure 55-15 is currently defined this allows and requires transition
to low power mode if either is detected. Transition to low power mode upon detection of
4x/L/I/+4x/L/I/ should not be permitted. Provision is required to allow for this special case
during low power mode in Figure 55-15a.

This comment is a duplicate of one against 55.3.5.2.4.

**Suggested Remedy**

Define LII as...
"LII: If the optional Low Power Idle function is supported then LII occurs when the vector
contains four /L/I/ control characters followed by four /I/ control characters."

Re-define LI as...
"LI: If the optional Low Power Idle function is supported then the LI type occurs when the
vector contains eight control characters of /L/I/.

In Figure 55-15...
Change the criteria for transition for the following transition to include LII:
TX_C to TX_E
TX_INIT to TX_E
TX_D to TX_E
TX_E to TX_E
TX_T to TX_E

In Figure 55-15a...
Change the criteria for transition from TX_L to TX_L (loop) to "T_TYPE(tx_raw)=(LI+LII)".
Alternately, change the criteria for transition from TX_L to TX_WN to
"T_TYPE(tx_raw)=(I+LII)".

**Proposed Response**

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

---

In Figure 55-15a, the transition from WX_WN to TX_WE should use tx_lpi_active=true.
Currently it uses tx_lpi_active=false. [i.e. transition from normal to error if a non-IDLE
character is detected before the PHY has completed wake].

**Suggested Remedy**

Change the transition from TX_WN to TX_WE to

`tx_lpi_active=True`
`T_TYPE(tx_raw)=((C.II)+D+E+LI+S+T)`

**Proposed Response**

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

---

Typo: loc_lpi_req should be tx_lpi_req in TX_WN in Figure 55-15a

**Suggested Remedy**

replace loc_lpi_req with tx_lpi_req

**Proposed Response**

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

| In Figure 55-15a, in several cases several boolean variable are redundantly equated with boolean values which is out of style with the rest of Clause 55 and adding extra clutter to a crowded SM. SuggestedRemedy Replace all instances of: <variable_name>=true with <variable_name> <variable_name>=false with !<variable_name> Example: Change "tx_lpi_active=false" to "tx_lpi_active". Proposed Response Response Status W PROPOSED ACCEPT. This is part of the editor's state diagram presentation.
In Figure 55-15, transition from TX_E due to L1 goes to connected labelled "L1".

Suggested Remedy
Re-label connector to "L".

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

In Figure 55-16a, in several cases several boolean variable are redundantly equated with boolean values which is out of style with the rest of Clause 55 and adding extra clutter to a crowded SM.

Suggested Remedy
Replace all instances of:
<variable_name>=true with <variable_name>
<variable_name>=false with !<variable_name>

Example:
Change "rx_lpi_active=false" to "!rx_lpi_active".

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

In Figure 55-16, there is no exit transition from RX_T due to L1.

Suggested Remedy
Add transition from RX_T to RX_L with criteria "L1"; use connector labelled "L".

PROPOSED ACCEPT.

This is part of the editor's state diagram presentation.

Type, change ldpc_frame_done to ldpc_frame_done.

**Suggested Remedy**

- Change ldpc_frame_done to ldpc_frame_done.

**Proposed Response**  **Response Status**: W  

PROPOSED ACCEPT.

[note two locations]

**Proposed Response**

PROPOSED ACCEPT IN PRINCIPLE.

Add the following definitions to 55.3.5.2.1

- `LP_BLOCK_T<64:0>` 65 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations
- `LP_BLOCK_R<71:0>` 72 bit vector to be sent to the LDPC encoder containing /LP/ in all the eight character locations

This is part of the editor's state diagram presentation.
In Figure 55-16b, in several cases several boolean variable are redundantly equated with boolean values which is out of style with the rest of Clause 55 and adding extra clutter to a crowded SM.

**Suggested Remedy**
Replace all instances of:
- `<variable_name>=true` with `<variable_name>`
- `<variable_name>=false` with `!<variable_name>`

**Example:**
Change "tx_refresh_active=false" to "!tx_refresh_active".

---

On the slave PHY, it is possible that the Rx is in lower power mode while the Tx is in Normal mode. The frequency drift limitation must also apply to the Tx in this scenario.

**Suggested Remedy**
Restate...
"When the transmitter is in the lower power mode or when the receiver is in lower power mode on a SLAVE PHY the transmitter clock short term rate of frequency variation shall be less than 0.1 ppm/second."

---

The current EEE Tx state machine enforces 9 LDPC frames of wake (IDLE characters) following alert. During these frames the state machine replaces XGMII data with IDLE characters. The value of tx_coded that goes into the scrambler is ambiguous in some cases (see comment #12).

**Suggested Remedy**
Figure 55-16b; EEE transmit state diagram
Transition from SEND_ALERT to TX_NORMAL when tx_lpi_alert_timer_done=true. Delete the SEND_WAKE and SEND_ERROR states and transitions to & from those states.
Figure 55-15a; delete TX_WN and TX_WE and the transitions to and from those states.
Add a transition from TX_L to TX_C when T_TYPE(tx_raw)=I and a transition from TX_L to TX_E when T_TYPE(tx_raw)=(S+E+D+T)
Similarly, it might also be desirable to change the SEND_SLEEP state to pass through XGMII codewords, instead of forcing tx_coded<=LP_IDLE.

---

The current EEE Tx state machine enforces 9 LDPC frames of wake (IDLE characters) following alert. During these frames the state machine replaces XGMII data with IDLE characters. The value of tx_coded that goes into the scrambler is ambiguous in some cases (see comment #12).

It would be preferable (and simpler) for the tx state machine to pass XGMII data through transparently. Higher layer system requirements mandate that the wake sequence is at least 9 frames of IDLE.

**Suggested Remedy**
Similarly, it might also be desirable to change the SEND_SLEEP state to pass through XGMII codewords, instead of forcing tx_coded<=LP_IDLE.

---

When the transmitter is in the lower power mode or when the receiver is in lower power mode on a SLAVE PHY the transmitter clock short term rate of frequency variation shall be less than 0.1 ppm/second.

**Proposed Response**
PROPOSED ACCEPT IN PRINCIPLE.
There doesn't appear to be any conflicting or overlapping changings. But editor will add editor's note to indicate P802.3ba may also affect clause 69.

---

P802.3ba will be adding the objective "a 4 lane 40Gb/s PHY. The addition by 802.3az of "Optionally support ENergy Efficient Ethernet will imply that 40GBASE-KR4 will support EEE."

**Suggested Remedy**
Change added objective text to
"Optionally support Energy Efficient Ethernet for PHYs that support MAC rates of 10 Gb/s or lower."

**Proposed Response**
PROPOSED ACCEPT.

**Comment Type** TR  **Comment Status** D

EEE needs to be added to Priority resolution. Since EEE is in an annex and unlike Clause 28, priority resolution is in the body, I'm not sure if it should be added to the existing resolution of 73.7.6 or as an additional subclause in Annex 73A but it needs to be somewhere.

**Suggested Remedy**

I suggest that EEE resolution should occur after priority resolution for PHY selection. If both sides support EEE for the selected PHY type, then EEE operation is enabled.

**Proposed Response**  **Response Status** W

PROPOSED REJECT.

There is no need to add EEE priority resolution as the EEE support resolution is simple and amply described in clause 78. This approach has worked adequately for 1000BASE-T MASTER/SLAVE resolution and many other more complex ability exchanges.

Proposed responses on D2

IEEE P802.3az D2.0 Energy Efficient Ethernet comments

D'Ambrosia, John
Force10 Networks

Cl 74 SC 74.5 P 214 L 50 # 119

Comment Type ER  Comment Status D

Proposed changes in 802.3az are only applicable to appropriate PHYs that support MAC rates of 10Gb/s. Proposed changes in 802.3ba are altering Clause 74 to support BASE-R PHYs, which would also include 40Gb/s and 100Gb/s. Therefore, it needs to be clear that the text in 802.3az should only be applied to sections specific to 10GBase-R PHYs.

Suggested Remedy

coordination between 802.3az and 802.3ba is necessary.

Add editor's note indicating that changes in 802.3az are only applicable to 10GBase-R PHYs.

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

Please refer to Comment response for #9

Marris, Arthur
Cadence

Cl 74 SC 74.5.4.1 P 215 L 3 # 365

Comment Type ER  Comment Status D

Why is this paragraph crossed out?

Suggested Remedy

Remove crossed out text.

Also remove all underlining from 74.5.4 and 74.5.5

Change:
"Insert 74.5.4 as shown below after 74.5.3"
to:
"Insert 74.5.4 and 74.5.5 as shown below after 74.5.3"

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

Accepting only the following:
Remove crossed out text.
Change:
"Insert 74.5.4 as shown below after 74.5.3"
to:
"Insert 74.5.4 and 74.5.5 as shown below after 74.5.3"

Rejecting:

Also remove all underlining from 74.5.4 and 74.5.5
- These are new text, it needs underlining.

Thaler, Pat
Broadcom

Cl 74 SC 74.5.4.1 P 215 L 9 # 438

Comment Type TR  Comment Status D

If this primitive is not removed (the subject of another comment of mine), this when generated section is incorrect.

Suggested Remedy

When generated for this should be similar to 74.5.3.2 - FEC generates the primitive when the energy_detect primitive it received from the PMA changes. The model of the primitives for boolean variables (which is different than the real life signals) is that the primitive is generated when the value changes.

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

ENERGY_DETECT is a indication coming from the PMA sublayer and FEC passes it to the PCS sublayer. Hence this primitive is not generated in the FEC sublayer.
Proposed responses on D2

Ganga, Ilango Intel

Clause 74 is also being amended by P802.3ba. So where appropriate update the editing instructions to indicate the appropriate base text (IEEE Std 802.3-2008 or P802.3ba/D2.2).

Suggested Remedy
As per comment

Proposed Response  Response Status  W
PROPOSED ACCEPT IN PRINCIPLE.

Please refer to #9

Thaler, Pat Broadcom

The reverse gearbox function in the FEC is suppose to get block lock on the data from the PCS using the block lock state diagram in Figure 49-12. This is in the current standard. This doesn’t work if deterministic blocks are to be produced with scrambler_reset.

The existing subclause does say that the reverse gearbox may not be required when the XSBI is not implemented.

Suggested Remedy
Add an edit to the subclause to say that when FEC is present, the reverse gearbox is not used and 66-bit block lock is provided from the PCS to the FEC in an implementation dependent manner.

Proposed Response  Response Status  W
PROPOSED ACCEPT.

Bennett, Michael LBNL

FEC doesn’t have frames, it has blocks. Even though once or twice the current Clause 74 has slipped up and used the wrong word, don’t extend that error.

Suggested Remedy
Replace all occurrences of “frame” in the text you have added to Clause 74 with “block”.

Proposed Response  Response Status  W
PROPOSED ACCEPT.
The use of "deterministic frame" implies that the FEC will be receiving one frame content that it can look for. This is not the case. It may receive a frame that is all LPI, one that is all normal idle, or one that starts out LPI and switches to normal idle (wake starts during the beginning of a refresh).

I couldn't find a prohibition on sending frames too early during waking though one would be foolish to do so. There is just informative material to explain the maximum wake up time. If the MAC sends frames too soon, is it assumed that it is okay for rapid block sync to not work. It seems like that should be okay.

Suggested Remedy

If it is acceptable for rapid block lock to only work for blocks that are all LPI or all idle, explain that lock needs to look for one of two deterministic blocks. If it needs to also work for a block with a transition between LPI and idle which means 256 possible blocks, state that.

Proposed Response

PROPOSED REJECT.

The deterministic fec blocks are transmitted only during wake up. That too, these blocks succeed 12us of scrambled IDLE codewords. There is 1us more wake time budgeted for in the total system wake time. If the MAC ignores the total system wake time and sends frames too soon, then it is in violation of the EEE time budget. At which point the receiver will not wake up properly.

Cl 74 SC 74.7.4.8
P 217 L 6 # 386
Thaler, Pat Broadcom

Comment Type TR
Comment Status D

There is no need to rename fec_block_lock. Renaming variables can cause confusion and it should only be done where necessary or too painful to not change it. Here that isn't the case.

If it is necessary for signal_detect to go true before fec_block_lock goes true, then change the description of fec_signal_ok to be based on the received SIGNAL_OK = OK and (fec_block_lock + fec_rapid_block_lock). In addition, there is a problem with getting signal detect from combining normal and fec block lock as it will glitch False. In the following description, I have used fec_block_lock for the name of the signal generated by the block lock machine rather than fec_normal_block_lock.

fec_rapid_block_lock is described as going false when it doesn't receive the deterministic block. 4 complete "deterministic" blocks are sent in a 1 us scrambler_reset. Some of those are eaten by the time for signal detect and clock recovery so there may be only 1 or 2 received. The first one received will cause fec_rapid_block_lock to go true and will cause the block lock state machine to start trying lock at that slip value. Within another block or two, the block received isn't deterministic and fec_rapid_block_lock goes false. However, it takes at least 4 good blocks for the state machine to set fec_block_lock true.

As currently described, at the start of a recovery period or exit from LPI, signal detect will probably go true for an FEC block or two due to fec_rapid_block_lock, then go false for a few blocks due to the gap between fec_rapid_block_lock = true and fec_block_lock = true.

Suggested Remedy

Don't change the name of fec_block_lock in the state machine. Just add fec_rapid_block_lock to the determination of signal_detect if it is necessary to speed that detection.

Additionally, if speeding the detection is necessary then fix the glitch where fec_rapid_block_lock goes false before fec_block_lock goes true.

Proposed Response

PROPOSED ACCEPT IN PRINCIPLE.

Will change the fec_normal_block_lock to fec_block_lock. And change the description for fec_signal_ok to add fec_rapid_block_lock.

Rejecting any change needed for glitch. The commenter state that 1 or 2 FEC blocks will be consumed by the CDR and signal detect circuit. But the deterministic fec blocks are transmitted after 12us of scrambled IDLE code words. Hence the CDR and signal ok will not consume those 1 or 2 frames. The FEC block lock needs at least 8 frames to loose lock.

Koenen, David Hewlett Packard

Comment Type E Comment Status D
The FEC encoder will not always be receiving unscrambled data if the PHY support EEE.

Suggested Remedy
Change sentence to: "If the optional Energy Efficient Ethernet function is supported (see Clause 78) then the reverse gearbox of the remote FEC encoder will receive unscrambled data low power idle periods. PCS sublayer will be encoding \(/I/\) during the wake state, which produces the deterministic FEC frame."

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Changing the sentence to:"If the optional Energy Efficient Ethernet function is supported (see Clause 78) then the reverse gearbox of the remote FEC encoder will receive unscrambled data when the transmitter is waking up from low power state. PCS sublayer will be encoding \(/I/\) during the wake state, which produces the deterministic FEC frame."
This paragraph seems verbose and repeats "is/are supported" several times. Why not use a table of supported PHYs instead?

Suggested Remedy
Replace paragraph with:

The EEE operational mode supports the IEEE 802.3 MAC operation at 100 Mb/s, 1000 Mb/s, and 10 Gb/s. The following PHYs are supported:

- 100BASE-TX
- 1000BASE-T
- 10GBase-T
- 1000BASE-KX
- 10GBase-KX4
- 10GBase-KR

PROPOSED ACCEPT IN PRINCIPLE.

Suggested remedy will be followed but it does not need a table - an inline list should achieve the same objective

Please define the acronym LPI after the first instance of Low Power Idle in the paragraph, as was done for Energy Efficient Ethernet and Media Access Control

Suggested Remedy
Insert (LPI) between Low Power Idle and mode.

In the next sentence, replace Low Power Idle with LPI.

PROPOSED ACCEPT.

"transition time to and from the lower level of power consumption is kept small enough to be transparent to" and not a "lower power period" or status or mode

Suggested Remedy
Per comment

PROPOSED ACCEPT IN PRINCIPLE.

Exact wording will be adjusted for best grammatical fit.

Change to: two PHY types, also change line 19 signaling systems to PHY types. Change other descriptions of PHY types as signaling schemes or signaling systems accordingly.

PROPOSED ACCEPT IN PRINCIPLE.

Editorial changes in section 78.1
"operation in Low Power Idle" > "operation the in Low Power Idle"
"When Low Power Idle" > "When the Low Power Idle"
"EEE also specifies a means for the capabilities negotiation to enable link partners to determine whether EEE is supported and selection best set of parameters common to both devices." > "EEE also specifies a means for capabilities negotiation to enable link partners to determine whether EEE is supported and selection the best set of parameters common to both devices."
"The definition of 10BASE-Te allows reduced power consumption" > "The definition of 10BASE-Te allows for a reduced power consumption"

SuggestedRemedy
Per comment

Proposed Response  Response Status W
PROPOSED ACCEPT.

Comment Type T  Comment Status D
"Idle on the RS" > "Idle through the RS". RS is not visible to the client on the other side of the link, so you can signal through it but not on it...

SuggestedRemedy
Per comment

Proposed Response  Response Status W
PROPOSED ACCEPT.

Comment Type TR  Comment Status D
When generated is too generic.

SuggestedRemedy
The primitive is generated because of a change from something (xMII normal Idle to assert low power idle) and vise versa.

Proposed Response  Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Adopt suggested remedy with editorial licence to clear typos/grammatical errors.

Replace "components" with "the LPI Client"
Proposed responses on D2

#212

Comment Type: E  Comment Status: D

Primitive and value are separated by a space.

Suggested Remedy

LP_IDLE.request (LPI_REQUEST), also similar on line 39.

PROPOSED ACCEPT.

Grow, Robert  Intel

#211

Comment Type: E  Comment Status: D

Anthropomorphism ('wishes'). Not the only occurrence.

Suggested Remedy

...to indicate to the PHY to start or stop... Rewrite other uses of wishes.

PROPOSED ACCEPT.

Grow, Robert  Intel

#327

Comment Type: E  Comment Status: D

Smaller font in "28.2.6.1.1". Increase the font to match the rest of the text

Suggested Remedy

Per comment

PROPOSED ACCEPT.

Hajduczenia, Marek  ZTE Corporation

#197

Comment Type: ER  Comment Status: D

Primitives are not signals, and as I recall, timing requirements can't be placed on the primitive, only on the layers causing generation of a primitive.

Suggested Remedy

Needs thought and proper specification on the timing in multiple places in the standard.

All text (e.g., assert and deassert functions) related to service primitives needs to be reviewed for any language that reflects continuous visibility of a primitive value between (sub)layers to only a change in value being signaled by a primitive.

PROPOSED ACCEPT IN PRINCIPLE.

Grow, Robert  Intel

#202

Comment Type: TR  Comment Status: D

Is signaling of LPI between an RS and its link partner, or between the RS and the lower parts of the PHY? If the PHY has no option to signal the request, then the language is appropriate, but it seems inconsistent with MII text describing the xMII signals. The effect of the primitive is to generate signals on the MII and that isn't specified here, but should be.

Suggested Remedy

Assure MII clause are consistent in what layer is signaling to what peer layer, and that any additional requirements on conveying the LPI request in lower sublayers is properly represented. Add generic text that covers the three MII types -- how the assert or deassert is signaled, can probably be generic using the MII definition of assert low power idle.

PROPOSED ACCEPT IN PRINCIPLE.

Grow, Robert  Intel

The PHY has no option to signal the request so the language is appropriate however editor will look into adding clarifying text as in the suggested remedy.

**Proposed responses on D2**

**IEEE P802.3az D2.0 Energy Efficient Ethernet comments**

**Proposed Response**

**Response Status**

**Proposed Accept.**

**Proposed Reject.**

**Suggested Remedy**

- Consider removing the function of generating 'assert low power idle' encoding on xMII from LPI assert function in RS per comment.
- In general, enumerating clauses is a bad idea because subsequent changes to the standard which introduce new clauses will require an otherwise unnecessary update to this text.
- Proposes a change to an architecture that has already been approved by the task force.

**Suggested Remedy**

- "can go quiet" - what does this mean? Does this mean that the transmission is suspended? Please clarify.
- "receives sleep", 'transmits sleep' - probably 'sleep signal' or something alike?
- "system energy savings can be achieved even if the PHY link does not go quiet." - not sure what is really meant in here. Does that mean that the link can be maintained active and still there is power saving potential? If so, this needs to be clarified.
- The commentor's interpretation is correct. Not sure why further clarification is needed.

**Editorial Changes**

- "triggered by the reception of sleep signal" > "triggered by the reception of sleep signal":
- "link partner. This signals that the link partner is about to enter Low Power Idle mode." > "link partner##, which indicates## that the link partner is about to enter ##the## Low Power Idle mode."
- "While the Link partner has ceased transmission the local" > "##When## the Link partner ##ceased## transmission##,## the local"
- "recovery time the link supports nominal operational data rate." > "##When## the link supports nominal operational data rate."

Proposed responses on D2

IEEE P802.3az D2.0 Energy Efficient Ethernet comments
September 2009

Cl 78 SC 78.1.4 P 231 L 31 # 10
Anslow, Pete Nortel Networks

Comment Type E Comment Status D
The title is "Relation of EEE to other standards" but the text seems to relate to 802.3.
802.3az is an amendment to 802.3, so "other standards" is inappropriate.
The title of Table 78-1 "Relation between EEE PHY's and IEEE protocols" is similarly inappropriate.

Suggested Remedy
Change subclause title to "EEE PHY types"
Change title of Table 78-1 to "EEE PHY types and associated clauses"

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.
See response to comment #198

Cl 78 SC 78.1.4 P 231 L 33 # 287
Hajduczenia, Marek ZTE Corporation

Comment Type T Comment Status D
Section 78.1.4 should be located at the very beginning of Clause 78, prior to making any specifications. PHYs in Table 78-1 should be collectively referred to as "supported PHYs" or "PHYs supporting EEE" or similar. Clause 78.1.4 is too late in the draft to be of much use.

Suggested Remedy
Per comment

Proposed Response Response Status W
PROPOSED REJECT.

Cl 78 SC 78.1.4 P 231 L 33 # 107
Chalupsky, David Intel Corp.

Comment Type T Comment Status D
The statement "EEE defines a Low Power Idle mode of operation for the following seven 802.3 PHYs" is inconsistent with the remainder of the draft as 10BASE-Te does not have an LPI mode.

Suggested Remedy
strike "Low Power Idle" from line 33.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.
Will strike "idle" from line 33.

TYPE: TR/technical required ER/editorial required GR/general required T/technical E/editorial G/general

Hajduczenia, Marek ZTE Corporation

Comment Type T Comment Status D
"It is the shortest period of time Rx system is provided between" - clarify the sentence.
Probably commas are missing here to clarify which part of the sentence is relative to which

Suggested Remedy
Per comment

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Change definition of Tw_sys_rx to:
Parameter employed by the system which corresponds to the behavior of the system.
It is the minimum time between a request to wake and readiness to receive data, for an Rx system.

Cl 78 SC 78.2 P 232 L 29 # 325
Hajduczenia, Marek ZTE Corporation

Comment Type E Comment Status D
"for the supported PHY's." - probably "for the supported PHYs."

Suggested Remedy
Per comment

Proposed Response Response Status W
PROPOSED ACCEPT.

Cl 78 SC 78.2 P 232 L 3 # 283
Hajduczenia, Marek ZTE Corporation

Comment Type T Comment Status D
What is this 'sleep signal'?
Replace the statement "Duration PHY" with "Time during which PHY" in lines 3 and 4.
What is "xxMII" - this term is neither defined anywhere nor even used consistently since in many places there is a term 'xMII' used instead. Decide on which term is to be used and then scrub the draft.

Suggested Remedy
Per comment

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Replace xxMII wth xMII
IEEE P802.3az D2.0 Energy Efficient Ethernet comments

Proposed reponses on D2

PROPOSED REJECT.

Comment Type: E  Comment Status: D  EEE cannot be used in only one direction for 1000BASE-T

SuggestedRemedy:

Change "If EEE is supported by both link partners for the negotiated PHY type then the EEE function may be used independently in either direction" to "If EEE is supported by both link partners for the negotiated PHY type then the EEE function may be used independently in either direction, with the exception of 1000BASE-T which requires that both link partners use EEE at the same time"

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type: T  Comment Status: D  What "the nomenclature was edited to align" with P802.3bc? Does this note need to be here at all?

SuggestedRemedy:

Clarify or remove

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type: TR  Comment Status: D  What is exactly the 'link rate' - is this the 'MAC rate' or a 'PHY rate'?

SuggestedRemedy:

Clarify. Try not to add new terms to the already existing nomenclature.

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type: TR  Comment Status: D  The nomenclature was edited to align with P802.3bc?

SuggestedRemedy:

Check the size of the font and adjust to the overall font format.

PROPOSED ACCEPT.
The text says "The state diagrams above" - which ones precisely?

Suggested Remedy
Add references to which state diagrams are referred to ...

PROPOSED ACCEPT IN PRINCIPLE.

"The state diagrams in Figure 78-4 and Figure 78-5 describe the behavior above"

to

PROPOSED ACCEPT IN PRINCIPLE.

Editorial changes in section 78.4.3.1
"During normal operation the transmitting link" to "During normal operation, the transmitting link"
"If the transmitting link partner wants to initiate a change to the presently resolved value of
Tw_sys, the local_system_change is asserted and the transmitting link partner enters the
LOCAL CHANGE state where NEW_TX_VALUE is computed" - this sentence is probably
missing a comma or two. "Otherwise it returns" to "Otherwise, it returns"
"receiving link partner it" to "receiving link partner, it"
"is lesser than either" - probably "is smaller than either"

PROPOSED ACCEPT.

Make the following changes to section 78.4.3.1
- "If presently advertised value" to "if the presently advertised value"
- "During normal operation the transmitting link" to "During normal operation, the transmitting link"
- "Otherwise it returns" to "Otherwise, it returns"
- "receiving link partner it" to "receiving link partner, it"
- "is lesser than either" - probably "is smaller than either"

</tbody>
</table>

**Comment Type:** E  **Comment Status:** D

**Proposed Response**

"In full duplex mode" to "In a full duplex mode" (scrub also the draft for the occurrences of the word 'mode' and make sure that the use of 'a' / 'the' before statement like 'full duplex mode', 'lower power mode' etc is consistent.). Additionally decide whether it is in ... mode' or 'at ... mode' since it is not used consistently. Also make sure that the 'Lower Power Idle' is superceded by a correct preposition i.e. either 'the' or 'a'.

"propagation delays through the network" to "propagation delay through the network" - there is only one delay through the network rather than multiple delays.

"mode, PHY device" to "mode, a PHY device" - also, scrub the draft for the term "PHY device" and make sure that 'a' / 'the' is used consistently.

"for data transmission request" to "for a data transmission request" - also, scrub the draft for the term "request" and make sure that 'a' / 'the' is used consistently.

"normal idle code" or "normal IDLE code"? Capitalization of the word "IDLE " is not consistent throughout the draft.

"the systems designer" to "a system designer"

**Suggested Remedy**

Per comment

**Comment Type: E**  **Comment Status: D**  **doc-structure**

The document structure introducing the EEE texts into the old ones must have already been fully discussed in the TF. But I still have a little concern that the current old texts will be mixed up and become confusing for the readers, when the editorial underlines finally disappear and conditional statements appear everywhere; if the optional EEE function is supported... if the optional low power idle function is implemented... and when the PHY supports EEE..

**Suggested Remedy**

The new Section6 of 802.3 with new Clause numbers may possibly be allocated to the whole EEE specifications, and old texts up to Section5 can basically keep the current description..

**Proposed Response**  **Response Status: W**

Add IEEE 802.3bc, 802.3ba and 802.3-2008/Cor1 to the list

**Suggested Remedy**
Insert the following amendments/corrigendum to the list in order:

- **IEEE Std 802.3bc-200X**
  This amendment includes changes to IEEE Std 802.3-2008 and adds Clause 79. This amendment transfers the IEEE 802.3 Organizationally Specific TLVs that were originally specified in IEEE Std 802.1AB Station and Media Access Control Connectivity Discovery to IEEE Std 802.3.

- **IEEE Std 802.3-2008T/Cor 1-200X**
  This corrigendum corrects the PAUSE reaction timing delay value for the 10GBASE-T PHY type.

- **IEEE Std 802.3baT-20XX**
  This amendment includes changes to IEEE Std 802.3-2008 and adds Clause 80 through Clause 88 and Annex 83A through Annex 83C, Annex 85A and Annex 86A. This amendment includes IEEE 802.3 Media Access Control (MAC) parameters, physical layer specifications, and management parameters for the transfer of IEEE 802.3 format frames at 40 Gb/s and 100 Gb/s.
