McDermott, Thomas   Fujitsu

Comment Type **TR**   *Comment Status* **D**

The text describes the "test procedure" essentially as

For each receive parameter in all receive parameters:
  For each transmit parameter in all transmit parameters:
    For each fiber parameter in all fiber parameters:
      Make sure it works.

This requires on the order of N^3 tests, it could be described as "engineering qualification". The expectation perhaps of both manufacturers and users of the specification is that some subset of corner cases is identified that highlight the significant worst-case conditions. Receive overload, receive minimum signal, fiber BW min, BW max, etc. These few cases are then described as the "test procedure".

Particularly, if in the field the link does not work, how is the user supposed to identify the problem? They and the manufacturer need a few tests to isolate the issue. Neither should be expected to run N^3 tests.

SuggestedRemedy

Create the small suite of corner cases that assist resolution of non-performant situations should they arise. Re-title the existing document "test procedure".

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Add proposal text 8023-114_rcvr_test_proc_190516.pdf after 114.6.3.3.
Update PICS items according to the new shall statements.

Comment Type **ER**   *Comment Status* **D**

Why do PHYs use "R" in the prefix? That is usually associated with 64b/66b encoding.

SuggestedRemedy

remove "R" from PHY names.

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

Port type naming was repeatedly discussed in SG and TF meetings and draft reviews. The R in our port type names is in the position typically used for optical wavelengths, where previous usage is in the PCS position. The specification of wavelength is felt appropriate for future development of longer reach POF port types (R for red LED and G for green laser were extensively discussed). Support for this was consistent (until this comment) after moving to the current port names.

John, D'Ambrosia   Futurewei, Subsidiary

Comment Type **ER**   *Comment Status* **D**

The term "GMII chunk" is not added to the definitions

SuggestedRemedy

add the definition for the term "GMII chunk" to 1.4"

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

The term is local and is not used outside of 114.2.4.1. Therefore, it is not felt necessary to include in the definitions of 1.4. Further, the TF also believes inclusion in definitions would reduce consensus.

Cl **114**   *SC* **114.1**   *P* **43**   *L* **8**   # 6

John, D'Ambrosia   Futurewei, Subsidiary

Comment Type **TR**   *Comment Status* **D**

The draft refers to and names three PMD sublayers: 1000BASE-RHA, 1000BASE-RHB, and 1000BASE-RHC. It talks about a family of 1000BASE-H family of PHYs, but they are never named. The term 1000BASE-RHx PHY is then referred to.

This lack of clarify makes it difficult to understand if there is a single PHY or family and what their names are. This is further confused by Fig 114-1, which only shows a single PHY stack.

SuggestedRemedy

Add table defining PHYs (name and description) see Table 80-1 as example.

add table defining the PHY and then the clause correlation - see table 80-4 as example.

In Fig 114-1
add PHY family name at bottom of stack - 1000BASE-RHx.
Rename "PCS" to "1000BASE-H PCS"

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change Pg 43, 8 through 12, to:
"1000BASE-H comprises a Physical Coding Sublayer (PCS) and a Physical Medium Attachment (PMA) sublayer that supports Physical Medium Dependent sublayers (PMD) for operation at 1000 Mb/s over duplex plastic optical fiber (POF) as the transmission medium. Three port types with different PMDs are defined: 1000BASE-RHA, 1000BASE-RHB, and 1000BASE-RHC (collectively referred to as 1000BASE-RHx)".

For consistency:
Pg 43, line 30: change "1000BASE-H family of PHYs" to "1000BASE-H based PHYs".
Pg 115, line 13: change 1000BASE-RHx to 1000BASE-H.
Pg 86, line 48: 1000BASE-RHx to 1000BASE-H based PHY.

John, D'Ambrosia   Futurewei, Subsidiary

Comment Type **TR**   *Comment Status* **D**

In the pics related to this section, only the STA transmission has a SHALL statement. IT would seem that the other main areas should have a corresponding "shall"

Local PHY acceptance simultaneous operation
acceptance of a new message for transmission
PHY reset

SuggestedRemedy

Review entire subclause -
add 1000BASE-H Tx and 1000BASE-H Rx PICS
add specific PICS to the different operations noted above.

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

STA transmission of a 1000BASE-H OAM message has a SHALL statement in Pg 108, line 26.
STA reception of a 1000BASE-H OAM message has a SHALL statement in Pg 110, line 28.

SHALL statements for PHY operation are:
Pg 112, line 47: "The PHY operation for 1000BASE-H OAM message transmission shall conform to the 1000BASE-H OAM transmit control state diagram in Figure 114–38."
and
Pg 114, line 6: "The PHY operation for 1000BASE-H OAM message reception shall conform to the 1000BASE-H OAM receive control state diagram in Figure 114–39."

Cl **114**   *SC* **114.9.2**   *P* **109**   *L* **4**   # 8

John, D'Ambrosia   Futurewei, Subsidiary

Comment Type **TR**   *Comment Status* **D**

No associated SHALL statements for channel status messages.

SuggestedRemedy

add appropriate SHALL statements

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

1000BASE-H OAM channel status is a consequence of the PHY operation according to the state diagrams of Figure 114-38 and Figure 114-39.
The shall statements are on the state diagrams, as indicated in response to comment #7.
A general shall here would be redundant with those more detailed shall requirements.

Comment Type **T**   *Comment Status* **D**

Fall edge overshoot specification is calculated considering the maximum value of the ER specification. To do that, it is taken into account that the minimum value of optical power transmit signal has to be larger than 0 to prevent signal clipping/saturation. The same limit is specified for rising edge overshoot, because symetry and linearity of the signal transient. In the market can be implementations of the PMD transmit function with accurate control of the ER in an small range (considering aging, temperature, process,etc) and other implementations where larger ER variations are permitted. Both implementations, being valid for GEPOF operation, are able to allow different levels of overshoot for correct operation.
The implementation with narrower control of ER can permit larger levels of overshoot while meets the criterion of no clipping. On the other hand, the implementations with larger variations of ER should take care of providing more controlled overshoot, to prevent cliping. Being said that, the maximum value of the overshoot specification should be dependent on the actual ER, but not on the maximum specified ER. This would produce a less constrained specification easier to implement.

SuggestedRemedy

In Table 114-8, replace value of Max column for Overshoot parameter with:
"$100/(10^{(ER/10)} - 1)$ a)"
Add footnote a): "Maximum permitted overshoot depends on the actual value of the transmit optical signal extinction ratio per provided equation."

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change footnote to:
"Maximum permitted overshoot depends on the actual transmit ER. The equation gives the maximum permitted overshoot as a function of the actual ER (in dB)."

The first sentence of subclause 114.7 'Characteristics of the fiber optic cabling (channel)' states that 'The fiber optic cable requirements are satisfied by cables containing IEC 60793-2-40 sub-category A4a.2 multimode plastic optical fibers.'. It is then stated that three fiber optic channel types are specified, and each of the types specified have a transfer function specification. On reading the response to unresolved D2.0 comment #159 it appears that this is placing additional requirements on the cables, over and above, but not in conflict with, IEC 60793-2-40 sub-category A4a. If this is the case this should be stated in the opening paragraph.

SuggestedRemedy

Suggest the first sentence of subclause 114.7 be changed to read '1000BASE-RHx operation requires fiber optic cable meeting the requirements of IEC 60793-2-40 sub-category A4a.2 multimode plastic optical fibers with appropriate augmentation as specified in this subclause.'.

Requirement can be improved including in an unique shall statement the specific bits transferred to each MLCC level. The figure that has been deleted from D2.0 to D2.1 can be included again to illustrate demultiplexing process.

SuggestedRemedy

Replace the text of sublause 114.2.4.3.1 with:
"The 3150 information bits to be encoded in an MLCC codeword shall be demultiplexed in two flows, being the bits $7xk + j$, for all k from 0 through 416 and all j from 0 through 3, transferred to the BCH encoder of the first MLCC level, and being the bits $7xk + j$, for all k from 0 through 416 and all j from 4 through 6, and the bits from 2919 through 3149 transferred to the second MLCC level, preserving the relative bit ordering in each flow.

Figure 114-17a illustrates the operation of the MLCC demultiplexer. In Figure 114-17a, bit quadruples a_i with i from 0 through 416 and bit triples b_i with i from 0 through 493 are the portions of information transferred to the first and to the second MLCC level, respectively. The term "4b" represents four bits groups, and the term "3b" represents three bits groups."

Add in Figure 114-17a, the figure 114-20 of D2.0.

The term "in-line" connection is used to indicate a connection used to connect fiber optic cable sections together. However, it is more common in 802.3 the use of the term "intermediate" connection. See for example clause 88.11.

SuggestedRemedy

Change "in-line" with "intermediate"

Comment Type **T**   *Comment Status* **D**

The fiber optic cabling model (channel) is not clearly defined as the cable from MDI to MDI.

SuggestedRemedy

Add new subclause just before the subclause 114.7, for "Fiber optic cabling model". Add a figure to illustrate the model. Move the following text from 114.7 to new subclause:
"A link uses two fibers, one for each direction (see 114.1.5). The fiber optic cabling model (channel) defined here is a simplex fiber optic link segment, which is sufficient for testing purposes."

Delete: "The term channel is used here for consistency with generic cabling standards."

   RE: Response to comment D2.0 #239. Response is unsatisfactory, untrue and non-
   responsive. Without a cited specification for either a standard connector or a standard
   procedure for cutting a fiber and testing the termination this proposed standard doesn't
   have a prayer in the consumer commodity market and therfore FAILS the Broad Market
   Potential criterium.

SuggestedRemedy
   See D2.0 comment 239

Proposed Response   *Response Status*   **W**
   PROPOSED ACCEPT IN PRINCIPLE.

   For automotive applications (RHC), the specification of the MDI connector is expected to be
   developed in other standardization body. ISO/TC 22/SC 32/WG10 has the mission of
   producing the specification of a MDI connector for GEPOF, among others specifications for
   automotive use of 1000BASE-RHC PHYs, like intermediate connectors, cable, harness,
   environmental tests, etc. These activities are outside the scope of 802.3.

   For industrial automation applications (RHB), many MDI connectors are already
   standardized for cables IEC 60794-2-41 (buffered A4 fibers): SMA, ST, FC, SC, SC-RJ,
   Versatile Link, SMI, etc. Selection of the connector depends on the specific application,
   and it is outside the scope of this standard to point a default connector.

   For home-network applications (RHA) there is not standardized MDI connectors in ISO,
   IEC, etc, therefore no pointer can be provided. However, the extended practice from many
   years in POF consumer grade products is that plug-less terminated IEC 60794-2-41 POF
   cables are connected to the PMD through a receptacle in the MDI.
   The minimum set of specifications for interoperability has been identified by the P802.3bv
   MDI ad-hoc group.

   Replace MDI subclause with text in RHA_MDI_proposal_8023bv_170516.pdf.

RE: Further response to comment D2.0 #239. Without a cited standard for how to parse the link budget for facilities installation and qualify installed facilities fiber you cannot achieve a consumer commodity standard.

SuggestedRemedy

See D2.0 comment 239

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

The draft provides the pointers to the standards requested by the commenter.

In 114.7.4 is stated:
"The fiber optic channel shall meet the insertion loss specification per measurement according to ISO/IEC 14763-3, under spectral distribution and launch modal power distribution at TP2 specified per EAF lower bound limits in 114.6.3.1."

In 114.7.5 is stated:
"The fiber optic channel shall meet the transfer function specification per measurement according to IEC 60793-1-41, under spectral distribution and launch modal power distribution at TP2 specified per EAF lower bound limits in 114.6.3.1."

In 114.6.4.11 is stated:
"The modal power distribution (MPD) at TP2 shall meet the specifications of 114.6.3.1 using an encircled angular flux (EAF) measurement method based on two-dimensional far field pattern data captured at TP2, which conforms to IEC 61300-3-53, defined for step-index multimode fibers."

Comment Type **TR**   *Comment Status* **D**

Pile-on to D2.0 Comment #155

SuggestedRemedy

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

In Pg 104, line 13, it is stated:
"Any fiber optic channel including in-line connections shall meet the transfer function specification of each type. The number of supported in-line connections is not normative but instead depends on the specific in-line connection technology." (approved comment #40, term "in-line" will be replaced by "intermediate").

In 114.7.4 and 114.7.5 are provided pointers to ISO/IEC standards of measurement methods of the insertion loss and the transfer function of the channel, respectively.

The link budget is given by the difference between min AOP in TP2 and the min AOP in TP3. The channel insertion loss is specified. So, as stated in 114.7.6, unallocated link margin may be used for in-line connections (connectors).

Therefore, the specifications of the fiber optics channel are complete and consistent, and no text should be deleted.

Brown, Matt   Applied Micro

Comment Type   **TR**   *Comment Status* **D**

The amendments to the definition are superfluous and gratuitous. The definition in 802.3-2015 does not impose particular details on related clauses other than the use of the first bit to differentiate data and control blocks. The phrase "mix of data and control" can mean no data and some control without the additional parenthetical. The new phrase "a set of" implies an intential group.

The IEEE-SA standards style manual says: "Each definition should be a brief, self-contained description of the term in question and shall
not contain any other information, such as requirements or elaborative text."

I would consider the amended text to be elaborative. It is also becoming prescriptive as it is dictating how the coding is to be specified.

SuggestedRemedy

Delete all changes to the definition, except addition of the cross reference to Clause 114.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Delete the parenthetical sentence "(possibly none)".
The rest of changes must remain, because they are neither "requirements nor elaborative text". The remainded changes provide information for the reader to understand that there are several codes that are different, but these codes share the name (i.e. 64B/65B) and the property of prepending a single bit to indicate wether the block contains only data or a mix of data and control information.
