The current method for optimizing the tap weighs of equalizer in the TDECQ reference receiver is described in clause 121.8.5. The equalizer tap coefficients are iteratively adjusted to effectively minimize the TDECQ penalty. Although not explicitly stated, one way to view this is that ANY combination of tap weights is valid and that ALL combinations should be tried to ensure the optimum tap weight combination is used when calculating TDECQ. As the equalizer length has been increased from 5 taps to 15 taps, the time required to verify all possible tap weights is likely problematic. This issue was managed in the 802.3 db project, where a 9 tap virtual equalizer is used for TDECQ. The following text was added to clause the definition of the TDECQ method: "The lowest measured TDECQ values are achieved with the equalizer optimization method described in 121.8.5. Alternative optimization methods such as minimum mean squared error (MMSE) may be used to determine equalizer tap weights to reduce test time, and are expected to report equal or higher values of TDECQ. These alternative methods should not be used for receiver sensitivity and stressed receiver sensitivity calibration". Note that the MMSE optimization method is used in almost all TDECQ measurements performed today

SuggestedRemedy

Add the following text at line 36 (end of exceptions list): The lowest measured TDECQ values are achieved with the equalizer optimization method described in 121.8.5. Alternative optimization methods such as minimum mean squared error (MMSE) may be used to determine equalizer tap weights to reduce test time, and are expected to report equal or higher values of TDECQ. These alternative methods should not be used for receiver sensitivity and stressed receiver sensitivity calibration

In this section, precoding is mentioned to CR, KR and C2C links. How about C2M link? It should add C2M since C2M LT session specifies precoding as one of the options.

SuggestedRemedy

Add C2M link into the statement: "The precoding specifications in this subclause apply to the input and output lanes of a PMA that are connected to the service interface of an xBASE-CRn or xBASE-KRn PMD, or are part of an xAUI-n C2C/C2M link."

econd sentence of the paragraph (dsicussing the distribution to 32 lanes by the tation function) sems to imply that the 32 lanes were interleaved into a serial stream ney were reordered and deskewed, but the text doesn't actually say that is done.

Remedy

ntent is that the 32 lanes are re-interleaved, and then the permutation function utes the symbols back to 32 lanes (in something other than a round-robin manner), e the end of the first sentence to say "...reordered, deskewed, and serialized". If the is that the permutation process just moves symbols around among the 32 lanes, e the second sentence to say "The RS-FEC symbols are then rearranged across the es by a permutation function.".

Comment Type **T** Comment Status **X**

The algorithm is unnecessarily complex. There is no need for bit-level detail since the operation is performed on 10-bit symbols - though really it seems to be performed on 160-bit entities. Per figure 184-3, it's essentially receiving as input alternating sets of 160 bits from flow0 and flow1, and changing the order from 0, 1, 0, 1, 0, 1, 0, 1 to 0, 1, 0, 1, 0, 1, 0.

SuggestedRemedy

A minimal change would be to state that the algorithm operates on 10-bit symbols, delete the for j... loop and its terminator, and replace "10i+j" with "I" in the statement that describes the permutation..

Another option would be to rewrite the description around the 160-bit entities as described, and perhaps also change the figure to show those instead of 40-bit entities (which as noted in a previous comment seem to have no relevance to this process, or to the convolutional interleaver process that follows it).

Proposed Response Response Status O

| C/ 184 | SC 184.4.4 | P 447 | L 22 | # 95 |
|------------|------------|--------------|-------------|------|
| Huber, Tho | omas | Nokia | | |

Comment Type T Comment Status X

The description of the convolutional interleaver process could be improved. The variable i is used in the first part of the subclause as an index for the delay lines and as an indication of time within a sequence. Then at the bottom of page 447 it's used a symbol index.

SuggestedRemedy

Revise the list above the figure to read as follows, eliminating the overleading of the index i and improcing the clarity a bit (and change the figure to label the lines as b=0, b=1, b-2):: a) The input and output switches are always aligned to the same row b, where b = 0 to 2

b) a block of 40 bits is read from row b

c) The concents of row b are shifted to the right by 40 bits

d) A block of 40 bits is written to row b

e) The switch position is updated to (b+1) mod 3

Proposed Response Response Status O

| Huber, Tho | mas | Nokia | | | |
| Comment | Туре Т | Comment Status | ζ. | | |

Since the convolutional interleaver operates separately on each PCS lane, there's no value in having an algorithm that includes the PCS lanes. Since it operates on 40-bit units, there's also no need to include bit-level description.

SuggestedRemedy

State that the algorithm describes the operation on the 40 bit entities and is run on each PCS lane independently. This allows elimination of the p and j variables.

Comment Type T Comment Status X

The algorithm relating the convolutional interleaver output to its input doesn't work when i<36 - it refers to negative block numbers for the input (permo) while the delay lines are filling, and those negative numbers need to be ignored as the process starts up. In other words, given the input sequence of 40-bit blocks 0, 1, 2, 3, ..., the convolutional interleaver is supposed to produce the output sequence 0, 3, 6, 9, 12, 15, 18, 1, 21, 4, 24, 7, 27, 10, 30, 13, 33, 16, then 36, 19, 2, and then each successive set of 3 is 3 more than the previous (so it continues 39, 22, 5, 42, 25, 8, ...). The algorithm says that output 0 is input 0-18 x (1 mod 3), which is -17, not 3.

SuggestedRemedy

The text above figure 184-4 already provides an algorithmix description of how the interleaver works. Rather than a second algorithmic description, it might be better to show the worked example as noted in the comment - i.e., show a table of input blocks from 0 to 42, and the corresponding output blocks.

Proposed Response

Revise the two pargraphs above table 184-1 to read as follows:

Response Status 0

For both DSP frame_0 and DSP frame_1, the generator is initialized using the seed at the start of every DSP frame. The generator produces a sequence of 192 bits. A zero bit inserted after each bit to generate the bit-pairs that form the pilot symbos, which use the outer points of the 16QAM constellation.

than 4-bit symbols without explaining that outputs 0 and 1 are for the X polarization (so the

X PRBS is spread across outputs 0 and 1) and outputs 2 and 3 are for the Y polarization.

The generator polynomial and seed values are shown in Figure 184-6 and listed in Table 184-1. The complete pilot sequence is shown in Table 184-2. The bit-pairs for the X polarization are distributed in a round-robin manner to outputs 0 and 1. The bit-pairs for the Y polarization are distributed in a round-robin manner to outputs 2 and 3.

| Comment | Type T | Comment Status X | | |

The editor's note suggesting that the mapping to analog signals probably belongs in the PMD clause seems to make sense, in which case this clause is really not "DP-16QAM mapping", it's really just mapping to 4-level signals, which the PMD will then turn into DP-16QAM.

SuggestedRemedy

Change the title to "4-level signal mapper", and make the corresponding change in 184.5.3.

|-----------|---------------|------------------|-------------|-------|
| Huber, Th | omas | Nokia | | |
| Comment | Type T | Comment Status X | | |

The paragraph that begins with "the signals Rx Xi, Rx XQ, ..." doesn't seem to make sense. The Tx and Rx signals are not guaranteed to be the same (i.e., Tx_XI can be received as any of the four components), but the contents of Tx_XI aren't distibuted to all the Rx signals.

SuggestedRemedy

Revise to say: The signals Rx XI, Rx XQ, Rx YI, and Rx YQ each represent one of the corresponding Tx_XI, Tx_XQ, Tx_YI, Tx_YQ signals from the transmitting PMD. The association between Tx and Rx components is arbitary (e.g., Rx XI can be any of the 4 Tx components).

| Comment | Type T | Comment Status X | | |

Similar changes should be made in the convolutional de-interleaver as were requested for the convolutional interleaver in earlier comments

SuggestedRemedy

Revise the items in the lettered list and the algoritm to align with whatever changes are agreed for the convolutional interleaver.

Comment Type TR Comment Status X

"When the receiver frame lock bit in the status field of transmitted training frames is set to 1, the time from the receipt of a new request to the acknowledgment of that request shall be less than 2 ms"

This requirement was defined in 802.3cd when training was limited in time (to 3 seconds) in order to prevent limiting the number of change requests due to delayed responses.

The new training scheme is not limited in time, and a receiver can use as many requests as it needs.

In some multi-tasking implementations, a hard 2 ms maximum may be challenging to meet. To avoid real-time requirements, it would be sufficient to have 2 ms as the average response time (and it does not need to be normative). The maximum response time can be relaxed without impact to the protocol.

SuggestedRemedy

Change to

"When the receiver frame lock bit in the status field of transmitted training frames is set to 1. the time from the receipt of a new request to the acknowledgment of that request shall be less than 20 ms. It is recommended that the average response time is less than 2 ms".

Proposed Response Response Status **O**

|------------|-----------|------------------|-----|-------|
| Ran, Adee | | Cisco | | |
| Comment Tv | vpe TR | Comment Status X | | |

Measurement methodology for C2M should consider the variable output settings that can result from training. Eye opening parameters with specific transmitter settings are not the relevant metrics for transmitter quality anymore.

The measurement methodology of CR transmitter, which focuses on training-related equalizer parameters and training-independent signal parameters, is more suitable.

SuggestedRemedy

Move the measurement methodology section into another annex that both Clause 179 and Annex 176E can refer to.

A detailed proposal will be provided.

Jitter specification is TBD.

Based on

https://www.ieee802.org/3/dj/public/adhoc/electrical/24 0104/calvin 3dj elec 01a 240104. pdf, the jitter measurement methodology of existing clauses 162, 163, and 120G (specifically using the two edges R03/F30) is feasible for measurements with a loss 30 dB. It is expected that the same method can be used for higher losses as long as the scope can maintain CDR lock.

This methodology should be used for all electrical interfaces, with adequate adjustments.

SuggestedRemedy

A detailed proposal will be provided.

Comment Status X Comment Type TR

The first subclause of Annex 174 is currently a mini "table of contents" of the clause. This isn't required.

Instead, an introduction to the annex would be helpful for readers. It should provide the relationship between bit error ratio as defined in the project's objective and the frame loss ratio, as well as the purpose of defining error requirements for internal interfaces within the physical layer.

SuggestedRemedy

A presentation with proposed content is planned.

| Comment Type TR Comment Status X 800GBASE-ER1-20 and 800GBASE-ER1 are both defined as using 800GBASE-R encoding, but per 802.3df-2024, 1.4.184e - "The term 800GBASE-R represents a family of Physical Layer devices using the Physical Coding Sublayer (PCS) defined in Clause 172 for 800 Gb/s operation." These two PHY's as noted in Table 169-3a, they use PCS encoding as defined in Clause 186. SuggestedRemedy Define new name for family / encoding based on Clause 186 encoding. Eliminate table entries for ER1-20 and ER1 from Table 169-3a. Create new table for PHY type and clause correlation for new family based on Clause 186 encoding. Modify description of entry for 800GBASE-ER1-20 in Table 169-1 to reflect new family name. Modify description of entry for 800GBASE-ER1 in Table 169-1 to reflect new family name. Proposed Response Response Status O |
| Cl 169 SC 169.1.4 P117 L12 # 316 D'Ambrosia, John Futurewei, U.S. Subsidiary of Huawei Comment Type TR Comment Status X Table 169-2 introduces the 800GBASE-R BM-PMA and 800GBASE-R-SM-PMA in Table 169-2, but there is no real explanation to the use of the sub-layers - just the required PMA service interfaces, as noted in Items C&E. The clarification of these two sublayers is actually defined in 176.2 Conventions, which doesnt make sense. SuggestedRemedy |
| |

Move definitions of 800GBASE-R BM-PMA and 800GBASE-R-SM-PMA from 176.2 to 169.1.3 Nomenclature

Proposed Response Response Status **O**

Comment Type TR Comment Status X

800GBASE-R BM-PMA and 800GBASE-R-SM-PMA are noted as optional in Tables 169-2. 169-3, and Table 169-3a, but that is not quite correct. They are conditional dependent on the PHY type and on whether specific AUIs are implemented or not.

SuggestedRemedy

For 100Gb/s based PHYs the 800GBASE-R BM-PMA is mandatory, all AUIs are optional, and 800GBASE R SM PMA is "C" / conditional if either 800GAUI-4 is implemented. For 200Gb/s based PHYs the 800GBASE-R SM-PMA is mandatory, all AUIs are optional, and 800GBASE R BM PMA is "C" / conditional if either 800GAUI-8 is implemented.

Change entries as described above in Tables 169-2, 169-3 and 169-3a for 800GBASE-R BM-PMA and 800GBASE-R-SM-PMA to C / with notes as stated above.

Modify entry in Table 178-3 to 800GBASE-R BM PMA to Conditional. Add note "c" A 800GBASE-R BM PMA must be implemented if a 800GAUI-8 C2C is implemented. Modify entry in Table 179-3 to 800GBASE-R SM PMA to Conditional. Add note "c" A 800GBASE-R SM PMA must be implemented if a 800GAUI-4 C2C is implemented. Modify entry in Table 180-3 to 800GBASE-R BM PMA to Conditional. Add note "c" A 800GBASE-R BM PMA must be implemented if a 800GAUI-8 C2C/C2M is implemented. Modify entry in Table 181-1 to 800GBASE-R BM PMA to Conditional. Add note "c" A 800GBASE-R BM PMA must be implemented if a 800GAUI-8 C2C/C2M is implemented. Modify entry in Table 182-3 to 800GBASE-R BM PMA to Conditional. Add note "c" A 800GBASE-R BM PMA must be implemented if a 800GAUI-8 C2C/C2M is implemented. Modify entry in Table 183-1 to 800GBASE-R BM PMA to Conditional. Add note "c" A 800GBASE-R BM PMA must be implemented if a 800GAUI-8 C2C/C2M is implemented.

Comment Type TR Comment Status X

In support of 200 Gb/s per lane signaling - 800GBASE-R BM-PMA, Clause 176 was developed. No addition was made to 169.2 Summary of 800 GbE archicture

SuggestedRemedy

Modify 169.2.4 to read -

The PMA sublayer provides a medium-independent means to support the use of a range of physical media.

The 800GBASE-R PMA, which supports bit multiplexing, is specified in Clause 173. The 800GBASE-R PMA, which supports symbol multiplexing, is specified in Clause 176. Note that "PMA" is used as a general term to represent both types of PMAs.

| | | | | | ~ | | | | |

800GBASE-ER1 and 800GBASE-ER1-20 use the Clause 186 800GBASE-ER1 PCS/PMA. This layer is not described as part of 169.2.

SuggestedRemedy

Create 169.2.4c 800GBASE-ER1 PCS/PMA

The 800GBASE-ER1 PCS performs encoding of data from the 800GMII, performs GMP mapping, applies FEC, and transfers the encoded data to the PMA. The 800GBASE-ER1 PMA sublayer perform the mapping of transmit and receive data streams between the PCS and PMA via the PMA service interface, and the mapping and multiplexing of transmit and receive data streams between the PMA and PMD via the PMD service interface. The 800GBASE-ER1 PCS is specified in Clause xxx.

| SuggestedF | | | | | Annex | 178A. Any | guidan | ce on appropriate choices for Ilation time step may be pro | or measuremen | it start frequency, |

In Table 176A-2, restore bits in control field bits 8 and 9 to the original "Modulation and precoding request" encoding defined in Clause 162. Define bits 5 and 6 to be "Test pattern request" with 00=PRBS13, 01=Free-running PRBS13, 10=Reserved, and 11=Free-running PRBS31. Restore bits 10 and 11 in the status field (Table 176A-3) to the "Modulation and precoding status" encoding defined in Clause 162. Define bits 12 and 13 to be "Test pattern status" using the same encodings as the control field. Update Figure 176A-2, 176A.3.2, and 176A.10.3.1 accordingly. Also add subclauses corresponding the Modulation and precoding request/status fields.

Proposed Response

Response Status 0

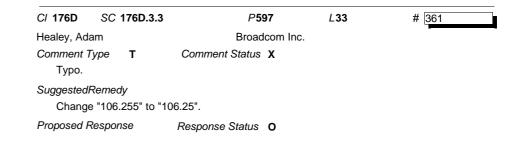

SuggestedRemedy

Remove these parameters from Table 178-13. Also remove these parameters from Tables 179-16 and Table 176D-7.

(see, for example, 178A.1.3). The values for these parameters rarely, if ever, change and it

seems unecessary to add a rows for them to an already lengthy table.

Shouldn't LR4 come before LR1 (same reach, narrower) and the order goes up the page, counting the bits forward

SuggestedRemedy

Swap 800GBASE-LR4 and 800GBASE-LR1

| The comment refers to The functions of "Delay | 0 | | | The paragraph Annex 176A fo | | y to the case of PMD contro ical interfaces | I function oper | ation, need to refer to |

by 2 RS-FEC codewords" on Tx path and "Delay even PCSLs by 2 RS-FEC codewords" can be misleading, as they could be interpreted as a delay by 10,880 symbols. The intention is to delay the odd (Tx) and even (Rx) PCSLs by 68 symbols in order to get

multiplex and demultiplex symbols from different 2 RS-FEC CWs. Same apply to Figure 176–13

SuggestedRemedy

. .

Modify the description in the Tx path box from "Delay odd PCSLs by 2 RS-FEC codewords" to "Delay odd PCSLs by 68 symbols" and in the Rx path box from "Delay even PCSLs by 2 RS-FEC codewords" to "Delay even PCSLs by 68 symbols"

| Rechtman | n, Zvi | Nvidia | | |
| Comment | Type TR | Comment Status X | | |

The text currently refers to xAUI-n C2C. However, the adopted PMA baseline proposal stated that the "Precoding capability in all physically instantiated interfaces is 'Tx:required, Rx:optional'" (per ran_3dj_01a_2303 slide 10). This specification should also encompass xAUI-n C2M.

SuggestedRemedy

Add xAUI-n C2M

Proposed Response Response Status O

_

SuggestedRemedy

Replace:

"If the PMA is connected to the service interface of an xBASE-CRn or xBASE-KRn PMD and training is enabled by the management variable mr_training_enable (see 136.7), then recoder_tx_out_enable_i and precoder_rx_in_enable_i shall be set as determined by the PMD control function in the LINK_READY state on lane i (see 136.8.11.7.5 and Figure 136–7). The method by which the MD control function affects these variables is implementation dependent."

With:

"If the PMA support the Control function and start-up protocol for electrical interfaces and training is enabled by the management variable mr_training_enable (see Annex 176A), then precoder_tx_out_enable_i and

precoder_rx_in_enable_i shall be set as determined by the control function in the LINK_READY state on lane i (see 176A.10.4 and Figure 176A–6). The method by which the PMA control function affects these variables is implementation dependent"

N (the number of consecutive PS symbols matching the expected value for a given polarization stream required to enter frame lock), and M (the number of consecutive PS symbols that don't match the expected value for a given polarization stream required to exit frame lock) used in Figure 184–9 'DSP lock state diagram' aren't defined in subclause 184.6 'Inner FEC state diagrams' or its subclauses.

Suggest that these values should be defined in one place (I assume in subclause 184.5.4 'DSP frame synchronization and pilot removal' which includes the text 'The values of N and M are TBD.), with a pointer to this subclause elsewhere.

SuggestedRemedy

[1] Insert a new subclause 184.6.5 'Constants' as follows, renumbering the following subclause.

184.6.5 Constants

Μ

The number of consecutive PS symbols that fail to match the expected value for a given polarization stream required to exit frame lock (see 184.5.4).

Ν

The number of consecutive PS symbols matching the expected value for a given polarization stream required to enter frame lock (see 184.5.4).

{2] In subclause 184.6.2 'Variables', change the text 'It is set to true when TBD PS symbols ...' to read 'It is set to true when M PS symbols ...' in the variable 'restart_lock' description.

Comment Type T Comment Status X

Subclause 176A.2.2 'Control and status fields' says that 'The control field comprises 16 bits with the structure defined in 176A.3.', yet figure 176A–1 'Training frame structure' above shows the control field comprising of 16 cells. It, therefore, appears that the field is comprised of 16 cells that convey 16 bits.

SuggestedRemedy

[1] Change the first paragraph of 176A.2.2 to read 'The control field is comprised of 16 cells which convey 16 bits with the structure defined in 176A.3. The status is comprised of 16 cells which convey 16 bits with the structure defined in 176A.4.

[2] Change the last sentence of the penultimate paragraph of 176A.2.2 to read 'Within each field, the order of transmission is from bit 15 to bit 0, conveyed by cell 15 to cell 0 respectively.'.

176A.4.8 'Coefficient status' says that 'The acknowledge reflects the value of coef_sts resulting from the procedure described in 176A.6.3.'. I don't see a procedure that sets coef_sts in 176A.6.3, but there is one in 176A.6.4. With that said, is it correct that it is just this procedure that sets coef_sts? On review of Figure 176A–9 'Coefficient update state diagram', I see it directly sets coef_sts to 'not_upd' in the OUT_OF_SYNC state and indirectly sets coef_sts using the procedure described in 176A.6.4 through calls to the UPDATE_C(k) function in the NEW_REQUEST state. This seems to be confirmed by the first paragraph of 176A.6.4 which says 'The handling of incoming requests is specified by the coefficient update state diagram (Figure 176A–9). The behavior of the UPDATE_C(k) function shall be consistent with the following algorithm.'.

SuggestedRemedy

Change 'The acknowledge reflects the value of coef_sts resulting from the procedure described in 176A.6.3.' to read 'The coefficient status bits reflect the value of coef_sts variable generated by the coefficient update state diagram (Figure 176A–9).'.

Comment Type T Comment Status X

The variables local_tf_lock, remote_tf_lock, local_rx_ready and remote_rx_ready are all defined in 176A.10.3 'Per-lane variables, functions, timers and counters' and are related to a lane, yet they are used by figure 176A-6 'Interface control state diagram'. 176A.10.2 'Per-interface variables, functions and timers' says 'A device implements one instance of each of the interface control state diagrams independently for each of its interfaces (see 176A.9).'.

SuggestedRemedy

Perhaps figure 176A-6 'Interface control state diagram' should use a 'interface' version of each of these variables that are a logical AND of the respective lane variable in the case of a multi-lane interface.

Proposed Response Response Status O

| C/ 176A | SC 176A.10.3.1 | P 565 | L 7 | # 573 |
|------------|----------------|--------------|------------|-------|
| Law, David | | HPE | | |

Comment Type T Comment Status X

The description of the local_tf_lock variable in 176A.10.3.1 says that 'The value of this variable is encoded as the "training lock" bit in the status field of transmitted training frames.', however, there isn't a "training lock" bit defined for the training frames. Since 176A.4.3 'Receiver frame lock' says 'Receiver frame lock ... is not set to 1 until training and local_tf_lock are both true.' it seems that local_tf_lock is encoded in the 'Receiver frame lock' bit.

SuggestedRemedy

Change the text '... is encoded as the "training lock" bit ...' in the local_tf_lock variable description to read '.... is encoded in the "Receiver frame lock" bit ...'.

Proposed Response Response Status **O**

| Comment Type T | Comment Status X | | |

176A.4.3 'Receiver frame lock' says that 'When the receiver frame lock bit is set to 1, the receiver is indicating that it has identified training frame marker positions and is in a state where the response time requirements specified in 176A.10 are met.'. It then goes on to say 'Receiver frame lock ... is not set to 1 until training and local_tf_lock are both true.'.

176A.10 is 'Variables, functions, timers, counters, and state diagrams', so I wonder if the reference should be to 176A.8 'Handshake timing'? In addition, I don't believe the variables training and local_tf_lock are conditioned on the response time requirements specified in 176A.10 being met, at least I didn't see it in their descriptions.

SuggestedRemedy

In 176A.4.3 change the text '... response time requirements specified in 176A.10 are met.' to read '... response time requirements specified in 176A.8 are met.' and the text '... and is not set to 1 until training and local_tf_lock are both true.' To read '... and is not set to 1 until training and local_tf_lock are both true and the response time requirements specified in 176A.10 can be met.'

Comment Type T Comment Status X

The UPDATE_IC function is called in the OUT_OF_SYNC state of the Figure 176A–9 Coefficient update state diagram. The UPDATE_IC function uses the ic_req variable to set the coefficients (see 176A.6.2), and the ic_req variable is derived from the 'initial condition request' bits from the control field of the received training frames (see 176A.10.3.1).

Since, however, the OUT_OF_SYNC state is entered during reset (reset or mr_restart set true), it would seem unlikely that training frames are being received. If that is the case, it isn't clear what the value of the ic_req variable is, and therefore what the coefficients should be set to.

176A.6.2 says that 'The transmitter equalizer is set to preset 1 upon entry to the QUIET state of the interface control state diagram.'. Since the QUIET state of the Interface control state diagram is also entered during reset, it seems the coefficients should be set to preset 1 when the Coefficient update state diagram is in the OUT_OF_SYNC state.

SuggestedRemedy

[1] Delete the first sentence of the ic_req definition in 176A.10.3.1.

[2] Add the text 'If the Coefficient update state diagram is in the OUT_OF_SYNC state ic_req is set to preset 1. Otherwise, it is derived from the "initial condition request" bit of the control field of received training frames on the correspondent lane of the interface.' to the end of the ic_req definition in 176A.10.3.1.

Comment Type T Comment Status X

176A.4.8 'Coefficient status' says 'The acknowledge reflects the value of coef_sts resulting from the procedure described in 176A.6.3.'. While it is correct that the coef_sts variable is updated by the UPDATE_C(k) function in 176A.6.3, I believe the OUT_OF_SYNC, NEW_INDEX, and WAIT states of the Coefficient update state diagram also update the coef_sts variable. Further, 176A.10.3.2 says that the ENCODE_STS function 'Encodes portions of the status field of transmitted training frames.' and that '... coef_sts is mapped to the coefficient status bits ...'.

SuggestedRemedy

Since calls of the UPDATE_C(k) function and direct updates of the coef_sts variable all occur in the Coefficient update state diagram, suggest that 'The acknowledge reflects the value of coef_sts resulting from the procedure described in 176A.6.3.' in 176A.4.8 should be changed to just read 'The acknowledge reflects the value of coef_sts generated by the Coefficient update state diagram '.

Comment Type TR Comment Status X

The use of the terms 'segment' and 'link' in Annexe 176A, for example in 176A.1 where it says, 'in single-segment or multiple-segment links', are problematic.

IEEE Std 802.3 subclause 1.4.505 'segment' defines it as 'The medium connection, including connectors, between Medium Dependent Interfaces (MDIs) in a CSMA/CD local area network.'. Subclause 1.4.372 'link' defines it as 'The transmission path between any two interfaces of generic cabling. (From ISO/IEC 11801.)'.

As a result, I believe it would only be correct to call an electrical channel between two PMD sublayers a 'segment'. I do not believe that the electrical channel between any other combinations of sublayers is a 'segment'.

SuggestedRemedy

I would suggest 'section' as an alternate to 'segment', but that was used for 'The portion of the link between the PSE Power Interface (PI) and the PD PI.' (see 1.4.378) when PoE had a similar definition problem. Alternatives, therefore, might be 'Division' and 'Sector'.

As another approach, the following is a rewording of 176A.1 to avoid the use of the terms 'segment' and 'link' without the use of a new term. I acknowledge, however, that such an approach would require a significant rewrite of the Annexxe.

The start-up protocol facilitates timing recovery and equalization of the electrical channel between adjacent sublayers, or chains of multiple adjacent sublayers while providing a mechanism through which the receiver can configure the transmitter to optimize performance. The protocol supports these functions through the continuous exchange of fixed-length training frames across the electrical channel between adjacent sublayers and the transport of end-to-end indications across chains of multiple adjacent sublayers.

Minimum transmit power specification has a big impact on coherent module designs. This has been defined in the initial proposals as a specification on the average power following other coherent physical layer specifications defined for DWDM systems. However, there is opportunity for a 800GBASE-LR1 PMD to change this in a way which can relax module transmit specifications

SuggestedRemedy

Define the minimum transmit power specification to be defined per lane instead of average. See https://grouper.ieee.org/groups/802/3/dj/public/23_11/kota_3dj_01a_2311.pdf for an initial proposal based on this concept. Defining the power per lane provides an opportunity to relax lane mismatch specs.

The draft contains separate specifications of X-Y power imbalances and I-Q imbalance. However, there is an opportunity for a 800GBASE-LR1 PMD to change this in a way which can relax module transmit specifications

SuggestedRemedy

Having a separate X-Y and I-Q imbalance specification splits the imbalance power budget and results in a tighter specification than necessary. These specifications should be combined into a single lane-to-lane imbalance specification. See https://grouper.ieee.org/groups/802/3/dj/public/23_11/kota_3dj_01a_2311.pdf for an initial specification methodology proposal.
