#1

**AUTOMOTIVE
REQUIREMENTS**
IN GENERAL

WHY IS AUTOMOTIVE DIFFERENT?

INTRODUCTION

- Modern vehicles are becoming moving Ethernet networks.
 - Automotive PHYs: 100BASE-T1, 1000BASE-T1, 10G/5G/2.5GBASE-T1, 25GBASE-T1.
 - Also: 10BASE-T1S – supporting shared medium for low-cost use cases
- Automotive OEMs produce many Ethernet networks per minute.
 - Fully automated production processes (e.g., key and certificate install) needed.
- Lots of multicast communication.
 - That's why many OEMs are introducing MACsec.
- Lots of safety critical and real-time communication.
- Vehicle startup performance is very critical!

WHY IS AUTOMOTIVE DIFFERENT?

VEHICLE STARTUP IS CRITICAL.

- How long should your car take to be ready to drive?
 - Typical target to achieve type approval: 1.5s – 2s (from touching car to driving off).
 - Critical features must work already (driving, breaking, steering, ...)
 - Mandatory Backup Cameras (e.g., US) needs to work, which may use Ethernet.
- 1.5 – 2s sounds like a lot but you need to:
 - Detect car is being unlocked
 - Power-Up/Wake-up and boot Electronic Control Units (ECUs) – think small computers.
 - Start stacks, middleware, applications, etc.
 - Get Ethernet links up (that's why T1 PHYs link up in 20-120ms).
 - Switches need to start too.
 - Start Secure Communication (e.g., MACsec for all links).

WHY IS AUTOMOTIVE DIFFERENT?

EVEN WORSE: STARTUP HAPPENS OFTEN...

- For power saving (= fuel saving) reasons, ECUs may go to sleep
 - And wakeup again, when needed --> think another startup
- Undervoltage when cranking a combustion engine
 - Multiple ECUs are knocked out and restart after a very short time.
 - Very fast restart needed as you need to drive soon.
 - Restarting your car on train tracks as a train gets closer...
- Startup happens very often and is highly critical!

WHY IS AUTOMOTIVE DIFFERENT?

LIFETIME AND COST

- Automotive needs to design for a long lifetime
 - Parts need to be available e.g., 10 years after end of production.
 - Electronics need to last longer than in IT.
 - E.g., flash wears over time, so we cannot just write to flash all the time.
- Environmental
 - ECUs need to work in for example -40°C to $+125^{\circ}\text{C}$ (-40 F to 257 F)
 - Higher temperatures zone exist.
- Cost is also very critical as so many ECUs are needed.

#2

AUTOMOTIVE REQUIREMENTS

MKA SPECIFIC

```
(groupsalloc);
EXPORTSYMBOL(groupsalloc);
void groups_free(struct group_info *group_info)
{
    void groups_free(struct group_info *group_info)
    {
        if (groupinfo->blocks[0] != group_info->small_block) {
            int i;
            if (groupinfo->blocks[0] != group_info->small_block) {
                for (i = 0; i < group_info->nblocks; i++)
                    freepage((unsigned long)groupinfo->blocks[i]);
                for (i = 0; i < group_info->nblocks; i++)
                    freepage((unsigned long)groupinfo->blocks[i]);
                kfree(groupinfo);
            }
            kfree(groupinfo);
        }
    }
}
EXPORTSYMBOL(groupsfree);
/* export the groupinfo to a user-space array */
static int groups_touser(gid_t_user *grouplist,
                        const struct group_info *group_info)
{
    const struct group_info *group_info;
    int i;
    unsigned int count = groupinfo->nblocks;
    int i;
    unsigned int count = groupinfo->nblocks;
    for (i = 0; i < group_info->nblocks; i++) {
        unsigned int cpcount = min(NGROUPSPERBLOCK, count);
        for (i = 0; i < group_info->nblocks; i++) {
            unsigned int len = cpcount * sizeof(*grouplist);
            unsigned int cpcount = min(NGROUPSPERBLOCK, count);
            unsigned int len = cpcount * sizeof(*grouplist);
            if (copyto_user(grouplist, group_info->blocks[i], len))
                return -EFAULT;
            if (copyto_user(grouplist, group_info->blocks[i], len))
                return -EFAULT;
        }
    }
}
```

WHAT DOES THIS MEAN FOR MKA?

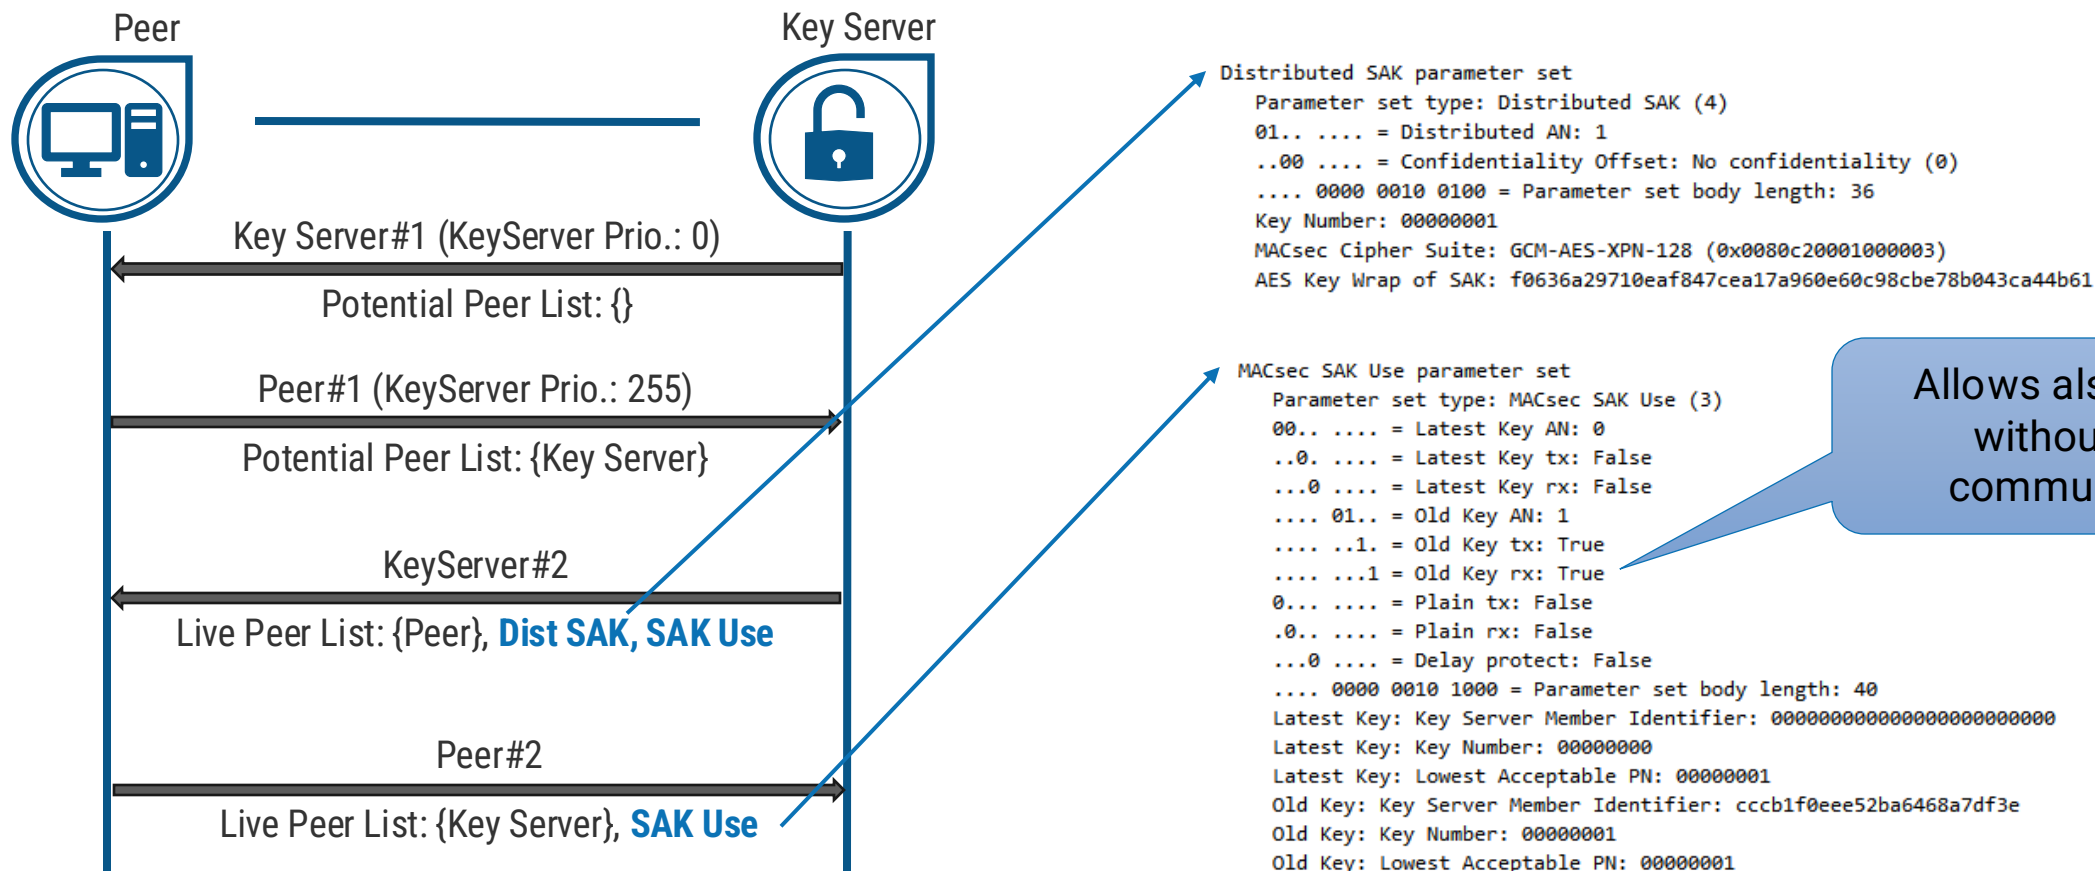

STARTUP PERFORMANCE OF “AUTOMOTIVE MKA”

- A typical Automotive Industry target for starting MACsec with MKA: <30ms.
 - MKA does not achieve this by default (8s or less guaranteed).
- As MKA makes sense for Automotive MACsec too:
 - Hard-coding Key Server priority and optimizing timings.
 - This allows for less than 10ms startup while being compatible to MKA (*).
 - However, this only works for Switch Ethernet (2 stations).
- Along came 10BASE-T1S Shared Medium
 - And startup timing for e.g., 7 stations is a problem again.

(*) measured as link-up to last SAK Use (RX=1, TX=1). Both implementations need to be optimized to achieve fast startup.

WHAT DOES THIS MEAN FOR MKA?

RECAP: MKA EXAMPLE WITH ONLY 2 STATIONS

Allows also to rekey without break communication.

WHAT DOES THIS MEAN FOR MKA?

RECAP: MKA RULES FOR STATIONS JOINING

- MKA needs to avoid reuse of key + salt + PN/XPN for security reasons.
- Also, reused PN/XPN might be detected as replay and not accept.
- MKA (see 802.1X-2020, 9.8):
 - Distribute new SAK on member joining.
 - Optional on member being removed.
- What can go wrong, if we can rekey in 30ms?

WHAT DOES THIS MEAN FOR MKA?

RECAP: MKA RULES FOR STATIONS JOINING (2)

- You could break the rekey in progress, but this might drop connectivity or make C's join late!
- Plus: ECUs are faster on startup but when MACsec is running, they have higher application load and MKA performance is reduced. Minimizing their work would help.
- Can we avoid Rekeying everyone, when someone joins?

#3

**AUTOMOTIVE VS.
MKA**

APPROACHES

APPROACHES INVESTIGATED.

APPROACH 1: “DO NOT REKEY ON JOIN”.

- On join: Key Server just redistributes SAK with same KN.
- On leave: Rekey.
- Does not work for XPN due to SSCI change. With 10Mbit/s acceptable!?
- How to ensure leave is detected before 6s timeout???
- With undervoltage situation, multiple stations fall out and come back.
 - It is right now not reliable to know, if a station used a SAK before going out.
 - You could have just lost a SAK Use.
 - We need to rekey on every station rejoining as we do not know what they used last.
 - This can lead to a staggered restart, which is the same as Rekey on Join.
- Overall: Degrades into the “Rekey on Join” worst case and does not help.

APPROACHES INVESTIGATED.

APPROACH 2: “KEY SERVER HOLDS STATE AND FAST FORWARDS”.

- Key Server collects and holds state of all stations (SAK Use).
- If a station comes back, Key Server sends state (like SAK Use content) out with key.
 - Key Server adds a margin to PN/XPN.
- This pushes stations XPN/PN forward
- Returning station needs to check all SAK Use of other ECUs to set up RX PN/XPNs.
- **Con: Incompatible MKA change.**

```
MACsec Key Agreement
└ Basic Parameter set
└ Live Peer List Parameter set
└ MACsec SAK Use parameter set
└ Distributed SAK parameter set

```

Example for illustration only

APPROACHES INVESTIGATED.

APPROACH 3: “SSCI BUMPING”

- Idea: Make SSCI changes on join/leave compatible.
 - Key Server adds new station to the peer list without changing other SSCIs.
 - Key Server does not free SSCIs, when station is removed, but marks them invalid.
 - When station rejoins, Key Server gives out new SSCI.
- Con: XPN only solution means higher cost. Better than no solution.
- Con: Not quite compatible to MKA:
 - SSCI list not ordered anymore. Is this a problem?
 - To be defined in MKA: How to mark SSCIs as invalid, so that they are ignored (KAY).

APPROACHES INVESTIGATED.

SUMMARY.

- Many approaches investigated (only showed 3 examples).
- No working solution that is fully MKA compatible was identified.
- Open questions:
 - How can we solve this?
 - Do we need to update MKA?
