Base Contribution: IEEE C802.16maint-08/278r1

Purpose: Review and discuss in support for the adoption of the proposal contained in C80216maint-08/278r1 into IEEE 802.16e Rev 2.

Notice: This document does not represent the agreed views of the IEEE 802.16 Working Group or any of its subgroups. It represents only the views of the participants listed in the “Source(s)” field above. It is offered as a basis for discussion. It is not binding on the contributor(s), who reserve(s) the right to add, amend or withdraw material contained herein.

Release: The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

Contents

- **Motivation**

- **Description of the proposal**

- **Use cases**
  - Current NWG LBS procedure
  - LS and LC direct communication
  - LS and LC communication with help of AAA-session
    - Anchor Authenticator sends LBS Measurement REQ
  - Ongoing periodic measurement with Anchor LC
    - Anchor LC initiates measurement
    - MS initiates measurement
    - Context transfer and LCID update

Obtaining measurements from MS in idle mode
Obtaining measurements from MS in idle mode

**Motivation**

- The current mechanisms in 802.16e for measurement requests and reporting using MOB_SCN-REQ/RSP/REP messages were designed for handoff so they are only allowed when the MS is not in idle mode.

- With the increase of Location Based Services, for example, measurement requests/reports will be more frequent and the MS would not necessarily need to exit idle mode
  - For a tracking-type application, for example, a location/position update may be needed without requiring the application to exchanged data with the MS.
  - Also, for radio resource management, MS location/position update while in idle mode may be useful.

- It is wasteful for the MS to reenter the network for measurement requests/reports and then enter idle mode immediately afterward.

- It is beneficial that the capability is available for the MS to stay in idle mode for measurement requests/reports in a similar way as for the Location Update procedure.
Obtaining measurements from MS in idle mode

Description of the proposal

• This proposal provides support for measurement requests/reports without requiring an MS in idle mode to perform a full network entry.
  - The already existing mechanisms used to allow an MS to perform Location Update without fully reentering the network are leveraged.
  - A measurement request is initiated in the access network by first paging an MS with a Location Update indication in order for the network to locate the serving Location Controller (LC) for the MS.
  - When the BS sends a RNG_RSP message with a Location Update success status, parameters may be included that request the MS to perform measurements and report the results.
  - The MS reports measurement results using the RNG_REQ message.
  - The measurement parameters included in RNG_RSP and RNG_REQ are based on the parameters in the MOB_SCN-RSP and MOB_SCN-REP messages.

• NWG LBS protocols and architecture
  - Currently, NWG is developing the protocols and architecture for Location Based Services.
  - Since measurement requests/reports are not allowed in idle mode, the NWG LBS document states that the MS must exit idle mode before performing measurements.
  - This presentation provides several use cases illustrating how a new capability in 802.16e for idle mode measurement requests/reports can be used in the NWG LBS framework.
Obtaining measurements from MS in idle mode

NWG LBS procedure

- LS gets the Anchor Auth ID for the MS from AAA
- Alternatively, the AAA-server could directly forward the location request to Authenticator who forwards it to the LC
- LS requests the LCID of the MS from the Anchor Auth
- Anchor Auth responds back to the LS with an ACK indicating that the MS is in idle mode
- Anchor Auth initiates paging of the MS with the PC

- MS is paged and exits idle mode
- Anchor Auth updates the LS with the LCID
- LS requests location report from LC
- LC requests LBS measurements for MS from BS
- BS sends MOB_SCN-RSP with measurement request
- MS performs measurements and reports results in MOB_SCN-REP
- BS sends report to LC
- LC calculates position and sends to LS
Obtaining measurements from MS in idle mode

LS and LC direct communication
Obtaining measurements from MS in idle mode

<table>
<thead>

<th>LS and LC direct communication</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Anchor Authenticator requests LCID from PC</td>
</tr>
<tr>
<td>• PC pages MS</td>
</tr>
<tr>
<td>• MS initiates location update, PC receives LCID, PC forwards LCID to Anchor Auth.</td>
</tr>
<tr>
<td>• PC continues location update</td>
</tr>
<tr>
<td>• Anchor Auth forwards LCID to LS</td>
</tr>
<tr>
<td>• LS requests location report from LC</td>
</tr>
</tbody>
</table>

| BS receives LU_Rsp from ASN but waits for LBS Measurement REQ before sending RNG_RSP based on parameter in Paging Announce |
| BS requests LBS measurements for MS from BS |
| BS sends RNG_RSP with location update status and measurement request, and includes dedicated ranging code, Rendezvous Time, and Transmission Opportunity for MS to use to report measurements |
| MS performs measurements |
| At the frame indicated by the Rendezvous time, BS sends UL-MAP with dedicating ranging region |
| MS transmits dedicated CDMA code in the ranging region based on the Transmission Opportunity and then completes ranging |
| BS correlates CDMA code to the MS |
| BS sends UL-MAP with CDMA Allocation IE including MS’s dedicated CDMA code and the transmission frame number, symbol, and subchannel with allocation size based on the measurement request size |
| MS sends RNG_REQ with measurement report |
| BS sends measurement report to LC |
| LC calculates position and sends to LS |
Obtaining measurements from MS in idle mode

**LS and LC communicate with help of AAA**

Session-Anchor Auth sends Meas. REQ

- LS sends location report request to AAA, AAA sends it to Anchor Auth
- Anchor Auth requests LCID from PC and PC pages MS
- MS initiates location update, PC receives LCID, PC forwards LCID to Anchor Auth.
- PC continues location update
- Anchor Auth requests location report from LC
- BS receives LU_Rsp from ASN

- BS waits for LBS Measurement REQ before sending RNG_RSP based on parameter in Paging Announce
- LC requests LBS measurements for MS from BS
- BS sends RNG_RSP with location update status, measurement request, and dedicated ranging info.
- MS performs measurements and reports results in RNG_REQ using dedicated ranging.
- BS sends report to LC
- LC calculates position and sends to Anchor Auth, Anchor Auth sends it to AAA, AAA sends to LS
<table>

- BS receives LU_Rsp from ASN but waits for LBS Measurement REQ before sending RNG_RSP based on parameter in Paging Announce.
- Anchor LC requests LBS measurements for MS from BS.
- BS sends RNG_RSP with location update status, measurement request, and dedicated ranging info.
- MS performs measurements and reports results in RNG REQ, BS sends report to Anchor LC.
- Anchor LC calculates position and sends to LS.

<tbody>
<tr>
<td>• LS has previously requested a periodic measurement</td>
</tr>
<tr>
<td>• MS has moved out of the original serving area</td>
</tr>
<tr>
<td>• LC associated with original serving area serves as Anchor LC</td>
</tr>
<tr>
<td>• For this scenario, MS manages periodic measurement</td>
</tr>
<tr>
<td>• To report periodic measurement data:</td>
</tr>
</tbody>
</table>

- MS sends **RNG_REQ** with
  - *pending measurement report* indication
  - *location update indication* to initiate location update
- BS sends **LBS Measurement REP** to ASN/LC with
  - *pending measurement report* indication
- ASN/LC does not have context for this MS
- ASN/LC sends **LCID REQ** to PC to obtain Anchor LC LCID for this MS
- PC sends **LCID RSP** with
  - *Anchor LC LCID*
- ASN/LC sends **LBS Measurement REP** message to Anchor LC with
  - *pending measurement report*
- Anchor LC sends **LBS Measurement REQ** with
  - *pending measurement report* to request pending report
  - *measurement report size* to assist the BS with bandwidth allocation for the MS’s measurement report
- BS sends **RNG_RSP** to MS with
  - *location update response*
  - *measurement report request*
  - *dedicated ranging parameters*
- BS sends **UL_MAP** with
  - dedicated ranging allocation for MS
- MS sends CDMA code provided in RNG_RSP using allocation provided in UL_MAP
- MS completes ranging
- BS sends **UL_MAP** with
  - allocation for RNG_REQ including measurement report using report size information received from Anchor LC
- MS sends **RNG_REQ** including measurement report
- BS sends **LBS Measurement REP** to Anchor LC with measurement report information
- Anchor LC calculates position and sends **Location Report RSP** to LS
Ongoing periodic measurement with Anchor LC

- LS has previously requested a periodic measurement
- MS has moved out of the original serving area
- Associated LC serves as Anchor LC
- Location update is performed and relocation of Anchor PC is to be done
- The current Anchor PC provides the current Anchor LC with the LCID of the target (new) Anchor LC
- The current Anchor LC sends the MS’s location context to the target Anchor LC
- The target Anchor LC sends an unsolicited LCID update to the LS, which LS may use to terminate periodic measurement
