Re:	IEEE P802.16e/D7	
Abstract	The existing PKMv2 is somewhat unorganized and insecure security framework. This contribution provides a resolution for unorganized and insecure MS's authorization flow in the PKMv2.	
Purpose	Adoption of proposed changes into P802.16e/D7	
Notice	This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.	
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16	
Patent Policy and Procedures	The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures < http://ieee802.org/16/ipr/patents/policy.html >, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard. "Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair < mailto:chiar@wirelessman.org > as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site < http://ieee802.org/16/ipr/patents/notices >.	

Corrections for the MS's Authorization Flow

Seokheon Cho, Sungcheol Chang, and Chulsik Yoon

ETRI

Introduction

The existing PKMv2 is somewhat in disorder and provides unorganized and insecure security framework. This contribution supports the backward compatibility with the PKMv1 and security framework of the PKMv2.

This contribution provides a resolution for those problems in the PKMv2.

0.1 IEEE P802.16e/D7 Status

The AK is derived from the PAK or/and the PMK. The PAK and the PMK are obtained from the RSA-based Authorization procedure and the EAP-based Authorization procedure, respectively.

0.2 Problems

- _ For the RSA-based Authorization procedure:
 - The Authorization Request message and the Authorization Reply message in the RSA-based Authorization procedure are in the same rank as the EAP Transfer message in the EAP-based Authorization procedure. The Authorization Request/Reply messages contains Security-Capabilities, SAID, and SA-Descriptors, but the EAP Transfer message doesn't contain those parameters.
 - The sequence number and lifetime included in the RSA-based Authorization procedure are not an AK sequence number and AK lifetime.
 - When the RSA-based Authorization procedure is selected, there is no message for informing the MS's authentication failure from BS to MS and the BS's authentication result (such as success or reject) from MS.
- _ For the EAP-based Authorization procedure:
 - The Key Sequence Number used in the Authenticated EAP-Transfer message is not an AK Sequence Number.
 - The BS doesn't know the completion time of the EAP-based Authorization procedure in case that EAP protocol doesn't yield AAA-key and whether an MS receives the last EAP Transfer message (such as "EAP Success" used in EAP-TLS) or not. Both the BS and the MS cannot simultaneously share the AK derived from PMK, when an MS doesn't receive the last EAP Transfer message.
- _ AK generation process needs more secure mechanism.

0.3 Solutions

- a) For the RSA-based Authorization procedure:
- Since the RSA-based Authorization is the same rank as the EAP-based Authorization, several attributes (such as Security-Capabilities, SAID, and SA-Descriptors) which are present in the EAP-based Authorization procedure, are omitted in the RSA-based Authorization procedure. The RSA-based Authorization procedure still supports mutual authentication. The messages in the RSA-based Authorization procedure are as follows:
 - The sequence number and lifetime included in the RSA-based Authorization procedure is not an AK sequence number and AK lifetime but the PAK sequence number and PAK lifetime.
 - To inform the MS's authentication failure from BS to MS, the PKMv2 RSA-Reject message is added. Also, to inform the BS's authentication result (such as success or reject) from MS to BS, Auth Result Code and Error-Code attributes shall be included in the PKMv2 RSA-Acknowledgement message.

- i. PKMv2 RSA-Request message: MS_Random, MS_Certificate
- ii. PKMv2 RSA-Reply message: MS_Random, BS_Random, Encrypted pre-PAK, Key lifetime (PAK), Key Sequence Number (PAK), BS_Certificate, SigBS
- iii. PKMv2 RSA-Reject message: MS_Random, BS_Random, Error-Code, Display-String, SigBS
- iv. PKMv2 RSA-Acknowledgement message: BS_Random, Auth Result Code, Error-Code, Display-String,

SigMS

b) For the EAP-based Authorization procedure:

- The messages used in the EAP-based Authorization procedure are as follows
- The Key Sequence Number used in the PKMv2 Authenticated EAP-Transfer message is not an AK sequence number but PAK sequence number.
- In order that BS knows the completeness time of EAP-based Authorization procedure in case that EAP protocol doesn't yield AAA-key and whether a MS receives the last EAP Transfer message (such as "EAP Success" used in EAP-TLS) or not, an MS shall send the PKMv2 EAP-Transfer-Complete message to report EAP-based Authorization completeness. Therefore, both MS and BS can synchronize the AK.

- i. PKMv2 EAP-Transfer message: EAP Payload
- ii. PKMv2 Authenticated EAP-Transfer message: Key Sequence Number (PAK), EAP Payload, OMAC Digest (from EIK)
- iii. PKMv2 EAP-Transfer-Complete message:

c) For MS's Authorization Key Generation procedure:

- To assure more secure AK, seeds (such as MS_Nonce and BS_Nonce) should be used to derive AK.
- To protect from replay-attack, the messages needed in MS's AK Generation procedure should contains random number (such as MS_Nonce and BS_Nonce) and message authentication function (such as OMAC Digest).
- The messages with important parameters, e.g. Security-Capabilities, SAID, and SA-Descriptors, should be authenticated.
- This procedure supports secure 3 way handshake.

- i. PKMv2 Authorization-Challenge message: BS_Nonce
- ii. PKMv2 Authorization-Request message: Key Sequence Number (PAK), MS_Nonce, BS_Nonce, Security_Capabilities, SAID, OMAC Digest (from AK)
- iii. PKMv2 Authorization-Reply message: Key Sequence Number (AK), Key Lifetime (AK), BS_Nonce, (one or more) SA-Descriptor(s), OMAC Digest (from AK)
- iv. PKMv2 Authorization-Reject message: Error-Code, Display-String, BS_Nonce, OMAC Digest (from AK)

Proposed Changes into IEEE P802.16e/D7

[Change sub-clauses 6.3.2.3.9.15 as follows]

~~6.3.2.3.9.15 Auth-Request message~~

6.3.2.3.9.11 PKMv2 RSA-Request message

A client MS sends a PKMv2 RSA-Request message to the BS in order to request mutual authentication in the RSA-based authorization.

Code: ~~21~~ 13

Attributes are shown in Table ~~37e~~ 37a.

Table ~~37e~~ 37a-Auth-Request-attributes-PKMv2 RSA-Request attributes

Attribute	Contents
SS_Random	A 64 bit random number generated in the MS
SS_Certificate	Contains the MS's X.509 user certificate
Security Capabilities	Describes requesting MS's security capabilities
AAID/SAID	Either the AAID or the Basic CID if in initial network entry
SigSS	An RSA signature over all the other attributes in the message

The MS-certificate attribute contains an X.509 MS certificate (see 7.6) issued by the MS's manufacturer. The MS's X.509 certificate ~~and Security Capabilities attribute~~ is as defined in 6.3.2.3.9.2.

The SigSS indicates an RSA signature over all the other attributes in this message, and the SS's private key is used to make an RSA signature.

[Change sub-clauses 6.3.2.3.9.16 as follows]

~~6.3.2.3.9.16 Auth-Reply message~~

6.3.2.3.9.12 PKMv2 RSA-Reply message

Sent by the BS to a client MS in response to ~~an Authorization Request~~ a PKMv2 RSA-Request message, the ~~Authorization Reply~~ PKMv2 RSA-Reply message contains ~~an AK~~ an encrypted pre-PAK, the key's lifetime, and the key's sequence number, ~~and a list of SA Descriptors identifying the Primary and Static SAs the requesting MS is authorized to access and their particular properties (e.g., type, cryptographic suite).~~ The ~~AK~~ pre-PAK shall be encrypted with the MS's public key. ~~The SA Descriptor list shall include a descriptor for the Basic CID reported to the BS in the corresponding Auth-Request.~~ The SS_Random number is returned from the ~~auth_req~~ PKMv2 RSA-Request message, along with a random number supplied by the BS, thus enabling assurance of key liveness.

Code: ~~22~~ 14

Attributes are shown in Table ~~37f~~ 37b.

Table ~~37f~~ 37b-Auth-Reply-attributes-PKMv2 RSA-Reply attributes

Attribute	Contents
MS_Random	A 64 bit random number generated in the MS
BS_Random	A 64 bit random number generated in the BS
Encrypted pre-PAK	RSA-OAEP-Encrypt(PubKey(MS), pre-PAK Id(MS)-SS ID)
Key Lifetime	AK PAK Aging timer
Key Sequence Number	64 bit AK PAK sequence number
(one or more) SA Descriptor(s)	The primary SA and zero or more static SAs. Each compound SA Descriptor attribute specifies an SAID and additional properties of the SA (optional, only if there is no EAP phase afterwards)
CertBS BS_Certificate	The BS Certificate Contains the BS's X.509 certificate
SigBS	An RSA signature over all the other attributes in the message

The SigBS indicates an RSA signature over all the other attributes in this message, and the BS's private key is used to make an RSA signature.

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.13 PKMv2 RSA-Reject message

The BS responds to an SS's authorization request with an PKMv2 RSA-Reject message if the BS rejects the SS's authorization request.

Code: 15

Attributes are shown in Table 37c.

Table 37c-PKMv2 RSA-Reject attributes

Attribute	Contents
MS_Random	A 64 bit random number generated in the MS
BS_Random	A 64 bit random number generated in the BS
Error-Code	Error code identifying reason for rejection of authorization request
Display-String (optional)	Display string providing reason for rejection of authorization request
SigBS	An RSA signature over all the other attributes in the message

The Error-Code and Display-String attributes describe to the requesting MS the reason for the RSA-based authorization failure.

The SigBS indicates an RSA signature over all the other attributes in this message, and the BS's private key is used to make an RSA signature.

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.14 PKMv2 RSA-Acknowledgement message

The MS sends the PKMv2 RSA-Acknowledgement message to BS in response to a PKMv2 RSA-Reply message or a PKMv2 RSA-Reject message. Only if the value of Auth Result Code is failure, then the Error-Code and Display-String can be included in this message.

Code: 16

Attributes are shown in Table 37d.

Table 37d-PKMv2 RSA-Acknowledgement attributes

Attribute	Contents
BS_Random	A 64 bit random number generated in the BS
Auth Result Code	Indicates result (Success or Failure) of authorization procedure.
Error-Code	Error code identifying reason for rejection of authorization request
Display-String (optional)	Display string providing reason for rejection of authorization request
SigSS	An RSA signature over all the other attributes in the message

The SigSS indicates an RSA signature over all the other attributes in this message, and the SS's private key is used to make an RSA signature.

[Change sub-clauses 6.3.2.3.9.11 as follows]

~~6.3.2.3.9.11 EAP-Transfer message~~

6.3.2.3.9.15 PKMv2 EAP-Transfer message

When an MS has an EAP message received from an EAP method for transmission to the BS or when a BS has an EAP message received from an EAP method for transmission to the MS, it encapsulates it ~~in an EAP-Transfer~~ a PKMv2 EAP Transfer message.

Code: ~~13~~ 17

Attributes are shown in Table ~~37a~~ 37e.

Table ~~37a~~ 37e –EAP-Transfer-attributes-PKMv2 RSA-Acknowledgement attributes

Attribute	Contents
EAP Payload	Contains the EAP authentication data, not interpreted in the MAC

The EAP Payload field carries data in the format described in section 4 of RFC 2284bis.

[Change sub-clauses 6.3.2.3.9.18 as follows]

~~6.3.2.3.9.15 Authenticated EAP message~~

6.3.2.3.9.16 PKMv2 Authenticated EAP-Transfer message

If EIK is available and an MS or BS has an EAP message received from an EAP method for transmission, it encapsulates EAP message in ~~a Authenticated EAP Transfer message~~ a PKMv2 Authenticated EAP Transfer message. In other words, this message may be used in case that both an MS and BS negotiate RSA-based authorization and Authenticated EAP-based authorization as authorization policy support.

Code: ~~24~~ 18

Attributes are shown in Table ~~37h~~ 37f.

Table ~~37h~~ 37f –Authenticated EAP message-attributes-PKMv2 Authenticated EAP Transfer attributes

Attribute	Contents
Key Sequence Number	AK-PAK Sequence Number
EAP Payload	Contains the EAP authentication data, not interpreted in the MAC
OMAC Digest	Message Digest calculated using EIK

The EAP Payload field carries EAP data in the format described in RFC 3748.

The OMAC-Digest attribute shall be the final attribute in the message's attribute list.

Inclusion of the OMAC digest allows the MS and BS to cryptographically bind previous authorization and following EAP authentication by authenticating the EAP message. The OMAC-Digest's authentication key is derived from the ~~AK-EIK~~.

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.17 PKMv2 EAP Transfer-Complete message

A MS sends the PKMv2 EAP-Transfer-Complete message to the BS to report completeness of EAP-based authorization procedure (PKMv2 EAP-Transfer message and PKMv2 Authenticated EAP-Transfer message). This message doesn't contain any attributes.

Code: 19

Attributes are shown in Table 37g

Table 37g-PKMv2 EAP-Transfer-Complete attributes

Attribute	Contents
-----------	----------

--	--

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.18 PKMv2 Authorization-Challenge message

The BS transmits the PKMv2 Authorization-Challenge message to an MS at initial authorization procedure or at reauthorization procedure. After achieving the RSA-based authorization procedure or/and the EAP-based authorization procedure, the BS sends the PKMv2 Authorization-Challenge message to BS to share the AK (Authorization Key).

Code: 20

Attributes are shown in Table 37h

Table 37h-PKMv2 Authorization-Challenge attributes

Attribute	Contents
BS_Nonce	A 64 bit pseudo-random or random number freshly generated by the BS

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.19 PKMv2 Authorization-Request message

Sent by a client MS to the BS in response to an PKMv2 Authorization-Challenge message, the PKMv2 Authorization-Request message may contain the pre-PAK's Sequence Number, the PMK's sequence number, MS_Nonce, BS_Nonce, Security Capabilities and SAID.

Code: 21

Attributes are shown in Table 37i

Table 37i-PKMv2 Authorization-Request attributes

Attribute	Contents
Key Sequence Number	PAK Sequence Number
MS_Nonce	A 64 bit pseudo-random or random number freshly generated by the MS
BS_Nonce	BS_Nonce included in the PKMv2 Authorization-Challenge message
Security_Capabilities	Describes requesting MS's security capabilities
SAID	MS's primary SAID equal to the Basic CID
OMAC-Digest	Message Digest calculated using AK

The pre-PAK Sequence Number and PMK Sequence Number shall be included in case of supporting the RSA-based authorization and the EAP-based authorization, respectively. And both pre-PAK Sequence Number and PMK Sequence Number shall be included when the RSA-based authorization and the EAP-based authorization are negotiated as authorization policy.

The Security Capabilities attribute is a compound attribute describing the requesting MS's security capabilities. This includes the data encryption, data authentication, and TEK(GTEK)/GKEK encryption algorithms the MS supports. The Security Capabilities and SAID attributes are as defined in 6.3.2.3.9.2.

The OMAC-Digest attribute shall be the final attribute in the message's attribute list.

Inclusion of the OMAC digest allows the MS and BS to authenticate the PKMv2 Authorization-Request message. The OMAC-Digest's authentication key is derived from the AK.

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.20 PKMv2 Authorization-Reply message

Sent by the BS to a client MS in response to an PKMv2 Authorization-Request message, the PKMv2 Authorization-Reply message contains the AK's lifetime, the AK's sequence number, and a list of SA-Descriptors identifying the Primary and Static

SAs the requesting MS is authorized to access and their particular properties (e.g., type, cryptographic suite). The SA-Descriptor list shall include a descriptor for the Basic CID reported to the BS in the corresponding PKMv2 Authorization-Request message. The MS_Nonce received from the PKMv2 Authorization-Request message is returned, along with Nonce supplied by the BS, thus enabling assurance of key liveness.

Code: 22

Attributes are shown in Table 37j

Table 37j-PKMv2 Authorization-Reply attributes

Attribute	Contents
Key Sequence Number	AK Sequence Number
Key Lifetime	AK Lifetime
BS_Nonce	BS_Nonce included in the PKMv2 Authorization-Challenge message
(one or more) SA-Descriptor(s)	The primary SA and zero or more static SAs. Each compound SA-Descriptor attribute specifies an SAID and additional properties of the SA
OMAC Digest	Message Digest calculated using AK

The OMAC-Digest attribute shall be the final attribute in the message's attribute list.

Inclusion of the OMAC digest allows the MS and BS to authenticate the PKMv2 Authorization-Reply message. The OMAC-Digest's authentication key is derived from the AK.

[Insert the following sub-clause in 6.3.2.3.9:]

6.3.2.3.9.21 PKMv2 Authorization-Reject message

The BS responds to a MS's PKMv2 Authorization-Request message with a PKMv2 Authorization-Reject message if the BS rejects the MS's authorization request.

Code: 23

Attributes are shown in Table 37k.

Table 37k-PKMv2 Authorization-Reject attributes

Attribute	Contents
Error-Code	Error code identifying reason for rejection of authorization request.
Display-String (optional)	Display string providing reason for rejection of authorization request.
BS_Nonce	BS_Nonce included in the PKMv2 Authorization-Challenge message
OMAC Digest	Message Digest calculated using AK

The Error-Code and Display-String attributes describe to the requesting MS the reason for the authorization failure.

The OMAC-Digest attribute shall be the final attribute in the message's attribute list.

Inclusion of the OMAC digest allows the MS and BS to authenticate the PKMv2 Authorization-Reject message. The OMAC-Digest's authentication key is derived from the AK.

~~[Delete 7.2.2.1] and [Insert 7.2.2.1 as follows] (Informative: Add the deleted contents in 7.2.2.1 into 7.2.2.3)~~

~~7.2.2.1 Security Associations~~

~~Upon achieving authorization, an MS starts a separate TEK state machine for each of the SAIDs identified in the Authorization Reply message. Each TEK state machine operating within the MS is responsible for managing the keying material associated with its respective SAID. TEK state machines periodically send Key Request messages to the BS, requesting a refresh of keying material for their respective SAIDs.~~

~~The BS responds to a Key Request with a Key Reply message, containing the BS's active keying material for a specific SAID.~~

~~The TEK is encrypted using appropriate KEK derived from the AK.~~

~~TEKs and KEKs may be either 64 bits or 128 bits long. SAs employing any ciphersuite with a basic block size of 128 bits shall use 128 bit TEKs and KEKs. Otherwise 64 bit TEKs and KEKs shall be used. The name TEK-64 is used to denote a 64 bit TEK and TEK-128 is used to denote a 128 bit TEK. Similarly, KEK-64 is used to denote a 64 bit KEK and KEK-128 is used to denote a 128 bit KEK.~~

~~For SAs using a ciphersuite employing DES-CBC, the TEK in the Key Reply is triple-DES (3-DES) (encrypt-decrypt-encrypt or EDE mode) encrypted, using a two-key, 3-DES KEK derived from the AK.~~

~~For SAs using a ciphersuite employing 128-bit keys, such as AES-CCM mode, the TEK in the key Reply is AES-encrypted using a 128-bit key derived from the AK and a 128-bit block size.~~

~~Note that at all times the BS maintains two active sets of keying material per SAID. The lifetimes of the two generations overlap such that each generation becomes active halfway through the life of its predecessor and expires halfway through the life of its successor. A BS includes in its Key Replies both of an SAID's active generations of keying material.~~

~~The Key Reply provides the requesting SS, in addition to the TEK and CBC initialization vector, the remaining lifetime of each of the two sets of keying material. The receiving SS uses these remaining lifetimes to estimate when the BS will invalidate a particular TEK, and therefore when to schedule future Key Requests such that the SS requests and receives new keying material before the BS expires the keying material the SS currently holds.~~

~~For SAs using a ciphersuite employing CBC-mode encryption the Key Reply provides the requesting MS, in addition to the TEK and CBC initialization vector, the remaining lifetime of each of the two sets of keying material. For SAs using a ciphersuite employing AES-CCM mode, the Key Reply provides the requesting MS, in addition to the TEK, the remaining lifetime of each of the two sets of keying material. The receiving MS uses these remaining lifetimes to estimate when the BS will invalidate a particular TEK, and therefore when to schedule future Key Requests such that the MS requests and receives new keying material before the BS expires the keying material the MS currently holds. For AES-CCM mode, when more than half the available PN numbers in the 31-bit PN number space are exhausted, the MS shall schedule a future Key Request in the same fashion as if the key lifetime was approaching expiry. The operation of the TEK state machine's Key Request scheduling algorithm, combined with the BS's regimen for updating and using an SAID's keying material (see 7.4), ensures that the MS will be able to continually exchange encrypted traffic with the BS.~~

~~The operation of the TEK state machine's Key Request scheduling algorithm, combined with the BS's regimen for updating and using an SAID's keying material (see 7.4), ensures that the SS will be able to continually exchange encrypted traffic with the BS.~~

~~A TEK state machine remains active as long as~~

- ~~a) the MS is authorized to operate in the BS's security domain, i.e., it has a valid AK, and~~
- ~~b) the MS is authorized to participate in that particular SA, i.e., the BS continues to provide fresh keying material during rekey cycles.~~

7.2.2.1 MS authorization and AK exchange

MS authorization procedure in PKMv2 constitutes three authorization exchange ways as shown in Fig xxx. Three authorization exchange ways are the RSA-based authorization process (), the EAP-based authorization process (_ or _ '), and the MS's Authorization Key Generation process (_).

There are PKMv2 RSA-Request, PKMv2 RSA-Reply, PKMv2 RSA-Reject, and PKMv2 RSA-Acknowledgement messages needed in the RSA-based authorization process (_). Both MS and BS shall share the same PAK derived from the pre-PAK.

There are two kinds of procedures in the EAP-based authorization process; the EAP Transfer procedure () to transfer only EAP payload and the Authenticated EAP Transfer procedure () to assure secure EAP payload transfer. Both MS and BS can share the same PMK derived from the AAA-key. Depending on the EAP protocol, however, the EAP method used can not yield an AAA-key and both of them shall not share the PMK.

There are PKMv2 Authorization-Challenge, PKMv2 Authorization-Request, and PKMv2 Authorization-Reply, and PKMv2 Authorization-Reject messages needed in the MS's Authorization Key Generation process (). Both MS and BS shall share the same AK derived from the PAK or/and the PMK, obtained in the RSA-based authorization process and the EAP-based authorization process, respectively.

Figure xxx-MS Authorization Procedure in PKMv2

In addition, several combinations of authorization process can be executed to finally obtain the AK in PKMv2 as follows.

- Only RSA-based authorization process () and MS's Authorization Key Generation process ()
- Only EAP-based authorization process (EAP Transfer:) and MS's Authorization Key Generation process ()
- RSA-based authorization process (), EAP-based authorization process (EAP Transfer:), and MS's Authorization Key Generation process ()
- RSA-based authorization process (), EAP-based authorization process (Authenticated EAP Transfer:), and MS's Authorization Key Generation process ()

One of above several authorization processes shall be selected by the Authorization Policy Support field included in the SBC-REQ and SBC-RSP messages.

MS authorization, controlled by the PKMv2 Authorization state machine, is in process as follows.

[Add the whole contents in 7.2.2.1 into 7.2.2.3 as follows]

7.2.2.3 ~~Associations~~ Security Associations

Upon achieving authorization, an MS starts a separate TEK state machine for each of the SAIDs identified in the Authorization Reply message. Each TEK state machine operating within the MS is responsible for managing the keying material associated with its respective SAID. TEK state machines periodically send Key Request messages to the BS, requesting a refresh of keying material for their respective SAIDs.

The BS responds to a Key Request with a Key Reply message, containing the BS's active keying material for a specific SAID.

~~The TEK is encrypted using appropriate KEK derived from the AK.~~

TEKs and KEKs may be either 64 bits or 128 bits long. SAs employing any ciphersuite with a basic block size of 128 bits shall use 128 bit TEKs and KEKs. Otherwise 64 bit TEKs and KEKs shall be used. The name TEK-64 is used to denote a 64 bit TEK and TEK-128 is used to denote a 128 bit TEK. Similarly, KEK-64 is used to denote a 64 bit KEK and KEK-128 is used to denote a 128 bit KEK.

For SAs using a ciphersuite employing DES-CBC, the TEK in the Key Reply is triple DES (3-DES) (encrypt-decrypt-encrypt or EDE mode) encrypted, using a two-key, 3-DES KEK derived from the AK.

For SAs using a ciphersuite employing 128 bits keys, such as AES-CCM mode, the TEK in the key Reply is AES encrypted using a 128 bit key derived from the AK and a 128 bit block size.

Note that at all times the BS maintains two active sets of keying material per SAID. The lifetimes of the two generations overlap such that each generation becomes active halfway through the life of its predecessor and expires halfway through the life of its successor. A BS includes in its Key Replies both of an SAID's active generations of keying material.

~~The Key Reply provides the requesting SS, in addition to the TEK and CBC initialization vector, the remaining lifetime of each of the two sets of keying material. The receiving SS uses these remaining lifetimes to estimate when the BS will invalidate a particular TEK, and therefore when to schedule future Key Requests such that the SS requests and receives new keying material before the BS expires the keying material the SS currently holds.~~

For SAs using a ciphersuite employing CBC mode encryption the Key Reply provides the requesting MS, in addition to the TEK and CBC initialization vector, the remaining lifetime of each of the two sets of keying material. For SAs using a ciphersuite employing AES-CCM mode, the Key Reply provides the requesting MS, in addition to the TEK, the remaining lifetime of each of the two sets of keying material. The receiving MS uses these remaining lifetimes to estimate when the BS will invalidate a particular TEK, and therefore when to schedule future Key Requests such that the MS requests and receives new keying material before the BS expires the keying material the MS currently holds. For AES-CCM mode, when more than half the available PN numbers in the 31 bit PN number space are exhausted, the MS shall schedule a future Key Request in the same fashion as if the key lifetime was approaching expiry. The operation of the TEK state machine's Key Request scheduling algorithm, combined with the BS's regimen for updating and using an SAID's keying material (see 7.4), ensures that the MS will be able to continually exchange encrypted traffic with the BS.

~~The operation of the TEK state machine's Key Request scheduling algorithm, combined with the BS's regimen for updating and using an SAID's keying material (see 7.4), ensures that the SS will be able to continually exchange encrypted traffic with the BS.~~

A TEK state machine remains active as long as

- a) the MS is authorized to operate in the BS's security domain, i.e., it has a valid AK, and
- b) the MS is authorized to participate in that particular SA, i.e., the BS continues to provide fresh keying material during rekey cycles.

Keying material is held within associations. There are three types of association: The security associations (SA) that maintain keying material for unicast connections, group security associations (GSA) that hold keying material for multicast groups and MBSGSAs which hold keying material for MBS services.
