# Components of a Complete RPR Proposal

# Objective

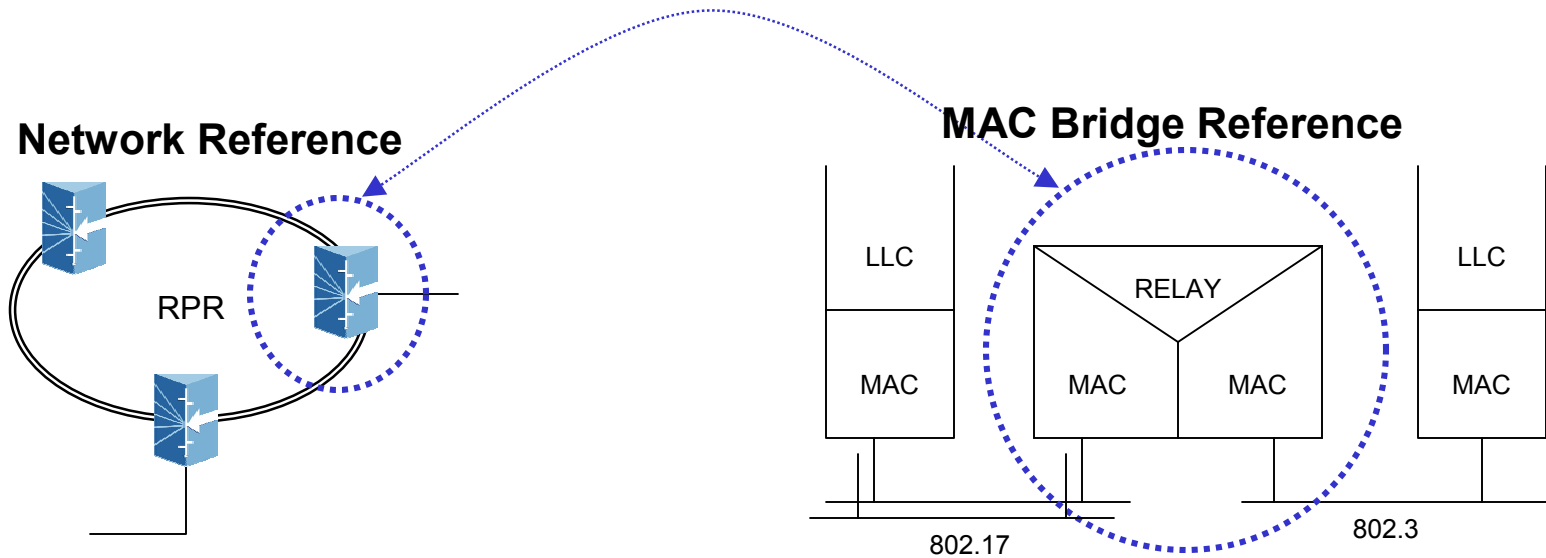

- Proposal of Encapsulated Bridging support for 802.17 MAC.
- Solution alignment with 802 and 802.1 Architecture.

# Outline

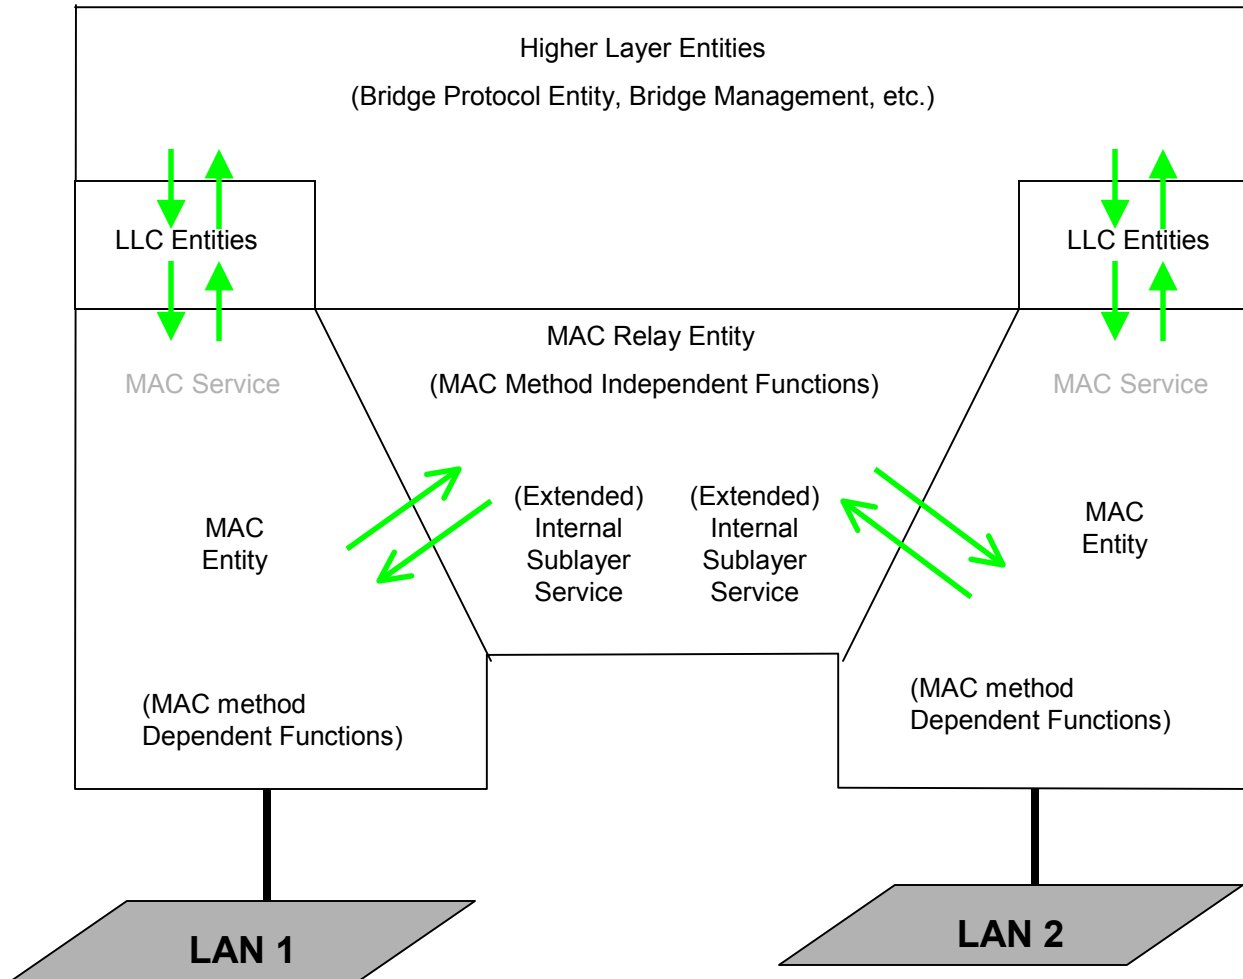

- 802.17 Bridge Reference Models
- Bridge Architecture
- Encapsulated Bridging Value Proposition
- Encapsulated Bridge Relay Entity Descriptions
- 802.17 MAC Extensions to support Encapsulated Bridging
- Conclusions

# 802.17 Bridge

Station on Ring is Bridge and the Ring is the shared LAN media.

# 802.1 Bridging Architecture

# Encapsulated Bridging Value Proposition

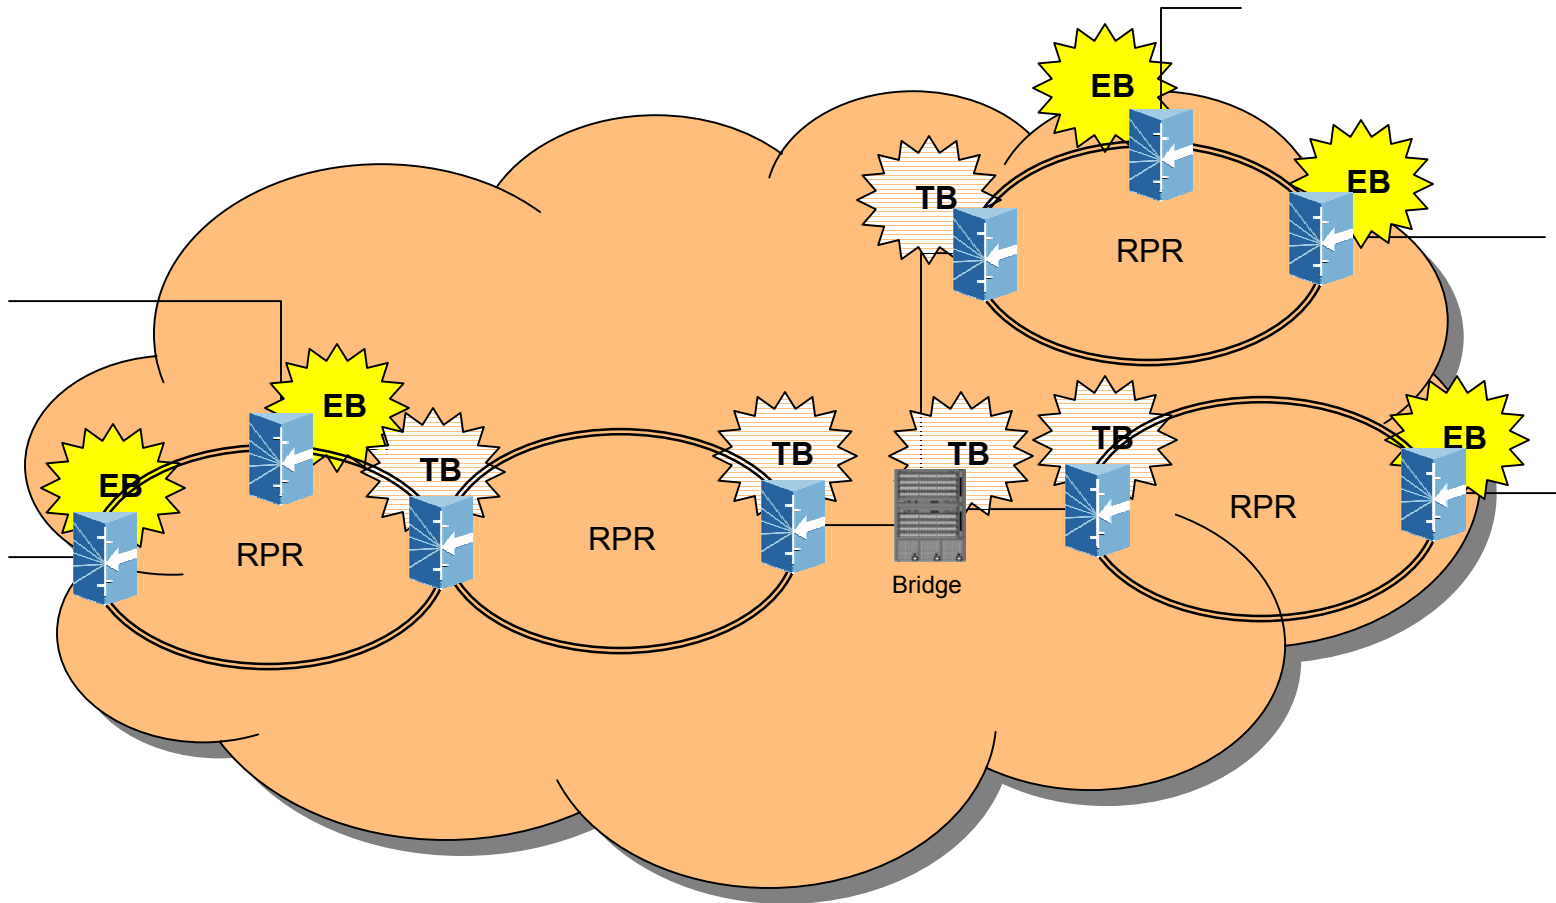

- ❑ From a (MAC learning) scaling perspective, Encapsulation Bridging benefits over Transparent Bridging is *only* realized in a Network setting (i.e., more than 1 switching device).
- ❑ Encapsulation Bridging (network) scaling benefits are not realized at the access/edge points of a Network, but at the core/interior of the Network.

# Encapsulated Bridging Value Proposition

	Edge/Access	Core
802.1D	<ul style="list-style-type: none"> <li>Bridge Relay FDB size scales with number of host MACs serviced by the Network. <math>O(h\_MAC)</math></li> </ul>	<ul style="list-style-type: none"> <li>Bridge Relay FDB size scales with number of host MACs serviced by the Network. <math>O(h\_MAC)</math></li> </ul>
Encap Bridge	<ul style="list-style-type: none"> <li>Bridge Relay FDB size scales with the number of RPR station MAC address within Service Provider Network. <math>O(s\_MAC)</math></li> <li>Some sort of DB is needed to associated host MACs with Ring station MACs. Consequently, this DB scales with number of host MACs. <math>O(h\_MAC)</math></li> </ul>	<ul style="list-style-type: none"> <li>Run <u>Transparent Bridge</u> in the core. Consequently, the Bridge Relay FDB size scales with number of RPR station MACs. <math>O(s\_MAC)</math></li> </ul>

Assume: Range of  $h\_MAC > s\_MAC$ !!

# 802.17 Encapsulated Bridging System

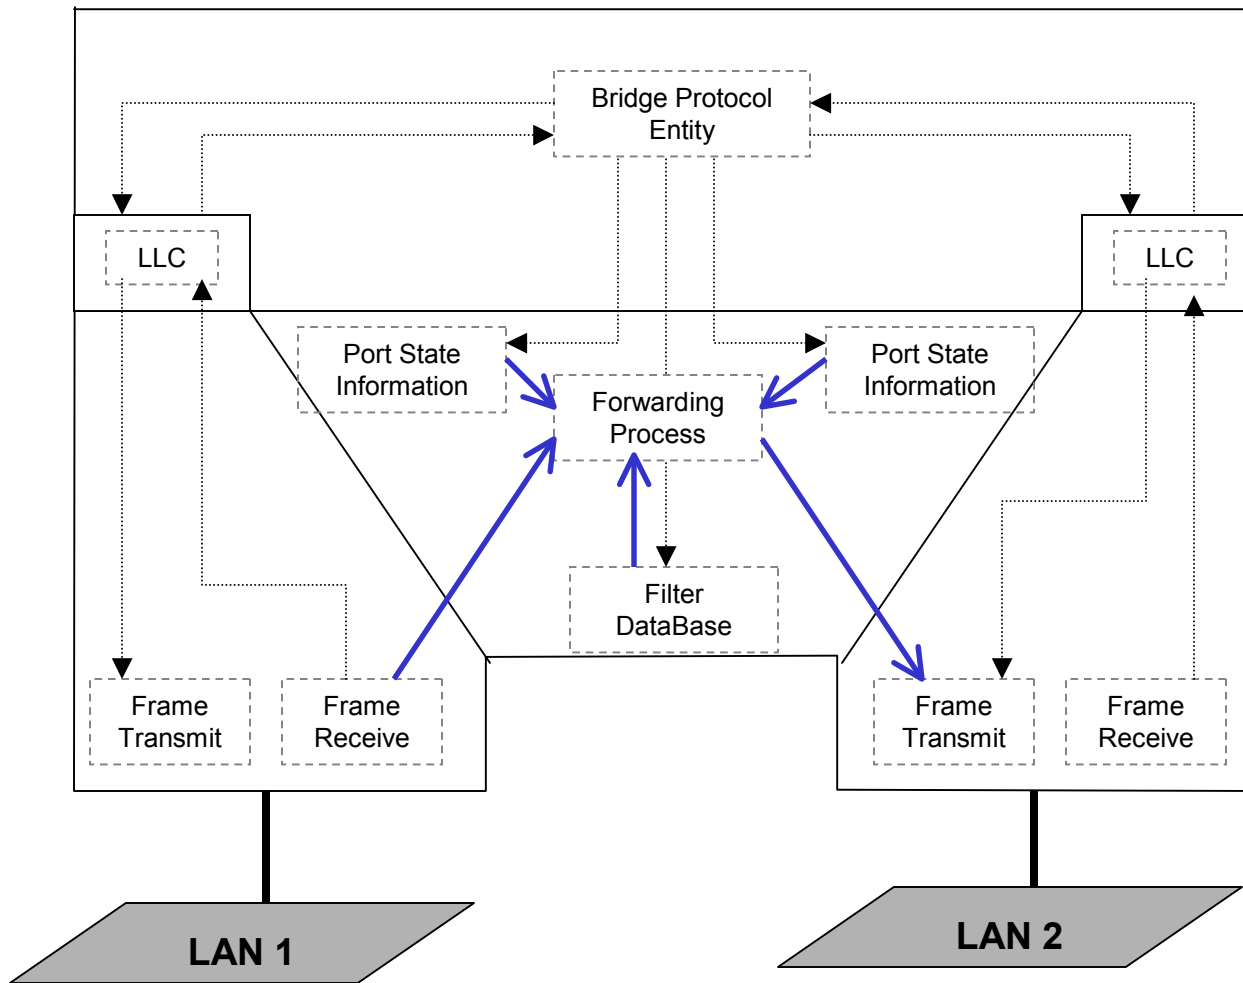

- **NOTE:** Encapsulated Bridge (EB) have DB that scale with the host MAC address space. The Transparent Bridge (TB) have DB that scale with the Network MAC address space. Consequently, the core of the Network scales (and is 802.1D compliant).
- **NOTE:** Value proposition only realized in a (contained) Network when all edge nodes are EB conformant, and interior nodes are TB (802.1D/Q) conformant.

A large, multi-pointed yellow starburst graphic with a black outline and a subtle gradient, serving as a background for the title text.

# **Encapsulation Bridging Definition and 802.17 MAC Entity Support Proposal**

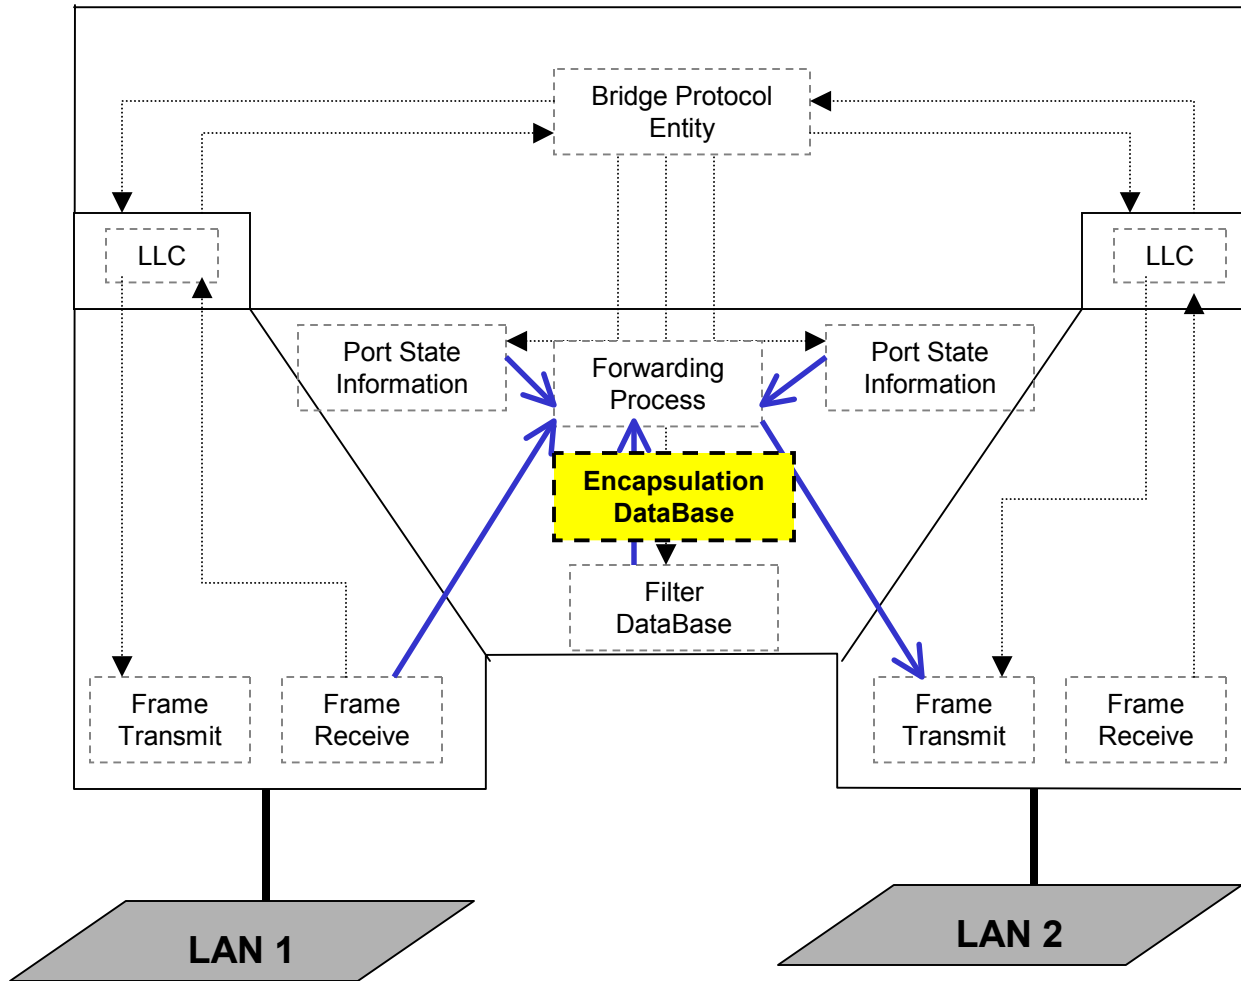

# Transparent Bridging (802.1D) Reference

—————▶ • Denotes Relaying MAC frames

.....▶ • Denotes reception and transmission of BPDUs

# Encapsulated Bridging Architecture

→ • Denotes Relaying MAC frames

.....▶ • Denotes reception and transmission of BPDUs

# Encapsulated Bridging Relay Entity

- ❑ Encapsulation Data Base is introduced. This DB will associate MAC address in one user space with MAC address in another user space. For example, associate MAC address in the Service Provider space (encapsulated address, typically those associated with the Stations on the Ring), and those of the Host MAC addresses.
- ❑ Utilizes Filtering Data Base as defined by 802.1D. The addresses stored in this DB are those of the Customer space (e.g., Host address space), local to the station.
- ❑ Relay Entity makes a decision to encapsulate packet with other address space (e.g., those associated with the MAC of the Ring stations), or de-encapsulate the relayed packet.

NOTE: The model of operation is in no way intended to constrain real implementations of a MAC Encapsulated Bridge. These may adopt any internal model of operation compatible with the externally visible behavior that this proposal specifies. Conformance of equipment to this specification is purely in respect of observable protocol.

# Encapsulated Bridging Internal Sub-layer Service

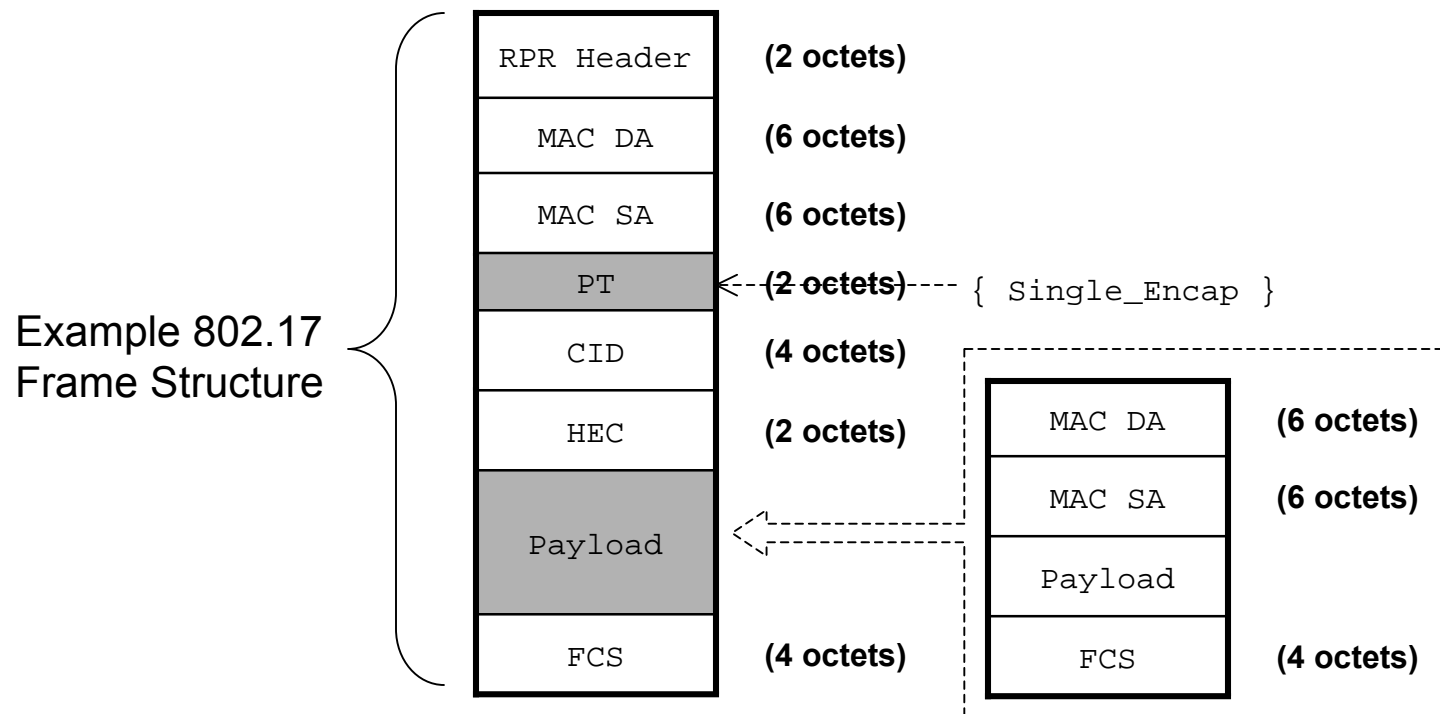

- ❑ A new Internal Sub-layer Service (ISS) is defined for usage in the Encapsulated Bridge Relay Entities. This ISS will be referred to as the Encapsulated Bridge ISS (EB-ISS).
- ❑ The EB-ISS will be an extension of the ISS defined by 802.1D (and 802.1Q). An additional Service primitive parameter is introduced. The parameter will be referred to as `EncapID`. This is an optional parameter in both the Request and Indication Service primitives.

NOTE: Current non-conformant Encapsulated Bridging MACs (e.g., 802.3 MAC) will never include this parameter in an Indication Service primitive (sent to a MAC Relay Entity), nor will receive one in a Request Service primitive.

- ❑ The 802.17 MAC Entity will provide the EB-ISS to the Encapsulated Bridge Relay Entity.
- ❑ Non-conformant Encapsulated Bridging MAC Entities will provide the applicable (802.1D/Q) ISS to the Bridge Relay Entity.

# 802.17 MAC Frame Format

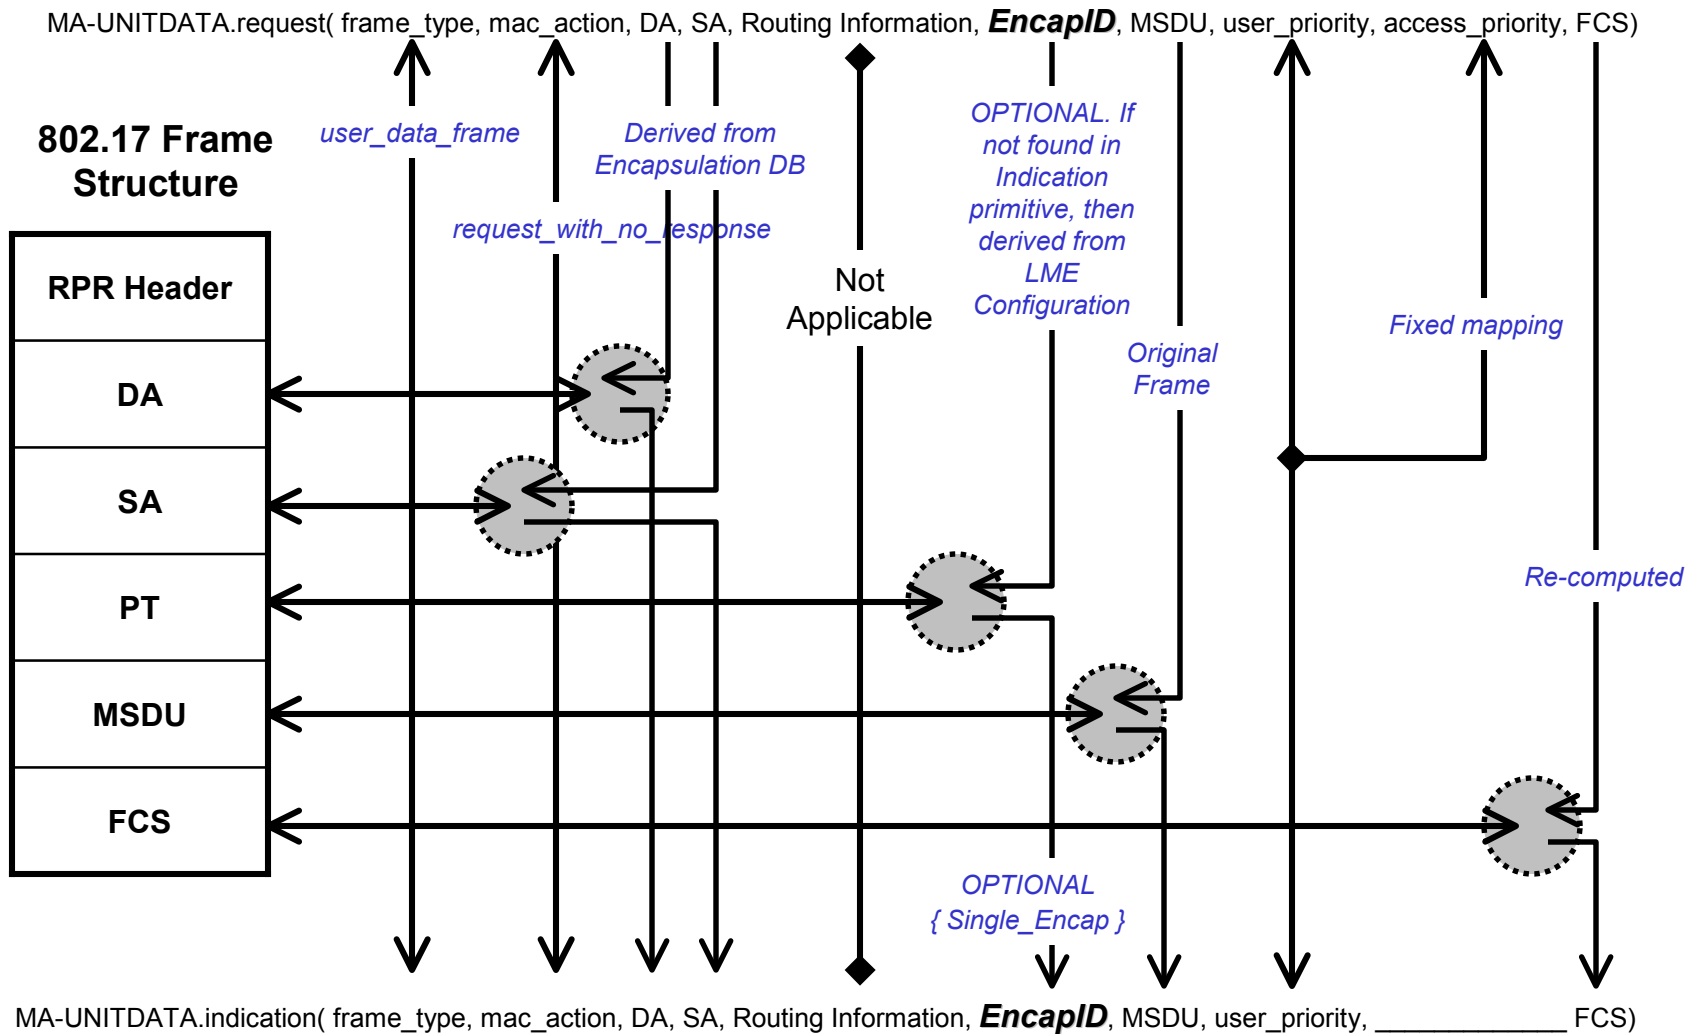

- ❑ Use the Payload Type (PT) field defined in the 802.17 frame structure to indicate that a packet is being encapsulated. The PT field is similar to the ET (Ethernet Type) field defined in 802.3.
- ❑ An additional PT value will be defined. The new value that is being considered is `Single_Encap`.

# ISS Service Primitives & Parameters

Service Primitive	Transparent Bridge (802.1D)	Encapsulated Bridge	VLAN Bridge (802.1Q)
Indication	<ul style="list-style-type: none"> <li>• Frame_Type</li> <li>• Mac_Action</li> <li>• DA</li> <li>• SA</li> <li>• RI</li> <li>• MSDU</li> <li>• User_Priority</li> <li>• FCS</li> </ul>	<ul style="list-style-type: none"> <li>• EncapID</li> </ul>	<ul style="list-style-type: none"> <li>• CFI</li> <li>• VLAN_Id</li> <li>• RIF_Info</li> </ul>
Request	<ul style="list-style-type: none"> <li>• Frame_Type</li> <li>• Mac_Action</li> <li>• DA</li> <li>• SA</li> <li>• RI</li> <li>• MSDU</li> <li>• User-Priority</li> <li>• Access_Priority</li> <li>• FCS</li> </ul>	<ul style="list-style-type: none"> <li>• EncapID</li> </ul>	<ul style="list-style-type: none"> <li>• CFI</li> <li>• VLAN_Class</li> <li>• RIF_Info</li> <li>• Include_Tag</li> </ul>

# EB-ISS Service Primitives Parameter Mapping

## 802.17 MAC Extensions to Support Encap Bridging

- ❑ This proposal builds on top of the 802.17 MAC extensions to support 802.1D/Q compliant Bridges.
- ❑ Upon frame reception, the 802.17 MAC will interpret the Payload Type (PT) in the 802.17 frame. If the PT denotes single Encapsulated Bridging, then the `EncapID` parameter (found in the EB-ISS Service Indication Primitive) is updated. The EB-ISS defined Service Indication Primitive is sent to the (Encapsulated) Relay Entity.
- ❑ Prior to frame transmission on the RPR, the 802.17 MAC will interpret the `EncapID` parameter found in the EB-ISS Service Request Primitive (if present) and set the PT field found in the 802.17 frame appropriately.

# Conclusions

- Encapsulated Bridging proposal supports 802.17 MAC.
- Encapsulated Bridging proposal is in-line with 802.1 Bridging Architecture.

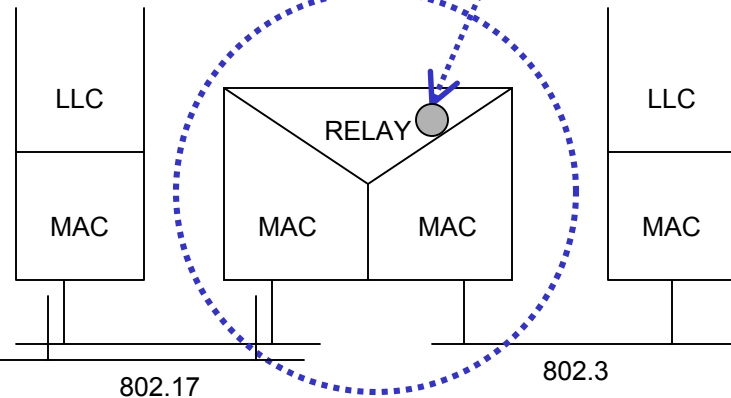

## Proposal Cost-Benefit Analysis

- ☑ Re-uses the 802.1D defined Bridge Protocol Entity.
- ☑ Supports STP (as defined in 802.1D), since can use 802.1D currently defined Bridge Protocol Entity.
- ☑ 802.1D defined interface between 802.17 MAC Entity and LLC layer can be used.
- ☑ Bridge aligns with 802.1 Architecture.
- ☑ Bridge Relay Entity is a simple extension of 802.1D defined Bridge Relay Entity.
- ☑ Solution can easily be extended to support other 802 MACs (e.g., 802.3).
  
- ✗ New Bridge Relay Entity needs to be introduced.

# Back Up Charts

# Encapsulated Bridge Relay Pseudo-Code

## MAC Bridge Reference

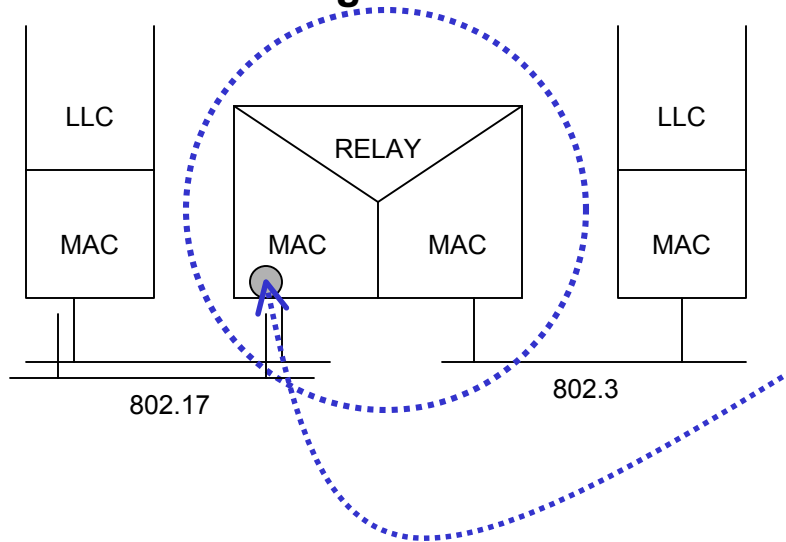

```

Case LME.Bridge in:
{ Encapsulate Bridge }:
  If Indication.EncapID
    /* Decapsulate Frame */
    { Single_Encap } -> type
    Indication.MSDU( type, SA ) -> Request.SA
    EncapDB.Update( Indication.SA, Request.SA, age )
    Indication.MSDU( type, DA ) -> Request.DA
    Indication.MSDU( type, Payload ) -> Request.MSDU
    Indication.MSDU ( type, FCS ) -> Request.FCS
  Else
    /* Encapsulate Frame */
    FDB.Update( Indication.SA, port, age )
    EncapDB.Update( Station.Addr, Indication.SA, age )
    { Single_Encap } -> Request.PT
    Request.MSDU( Indication.SA, Indication.DA, Indication.MSDU,
    Indication.FCS )
    EncapDB.Index( Indication.DA ) -> Addr
    If ( addr == NIL )
      #FFFFFFF -> Request.DA
    Else
      Addr -> Request.DA
    End If
    Station.Addr -> Request.SA
    Request.ReComputeFCS()
  End If
{ Transparent Bridge }:
  /* Perform 802.1D/Q operations */
End Case
Request.DispatchToMAC()
  
```

# 802.17 MAC Enhancements Pseudo-Code

## MAC Bridge Reference

```

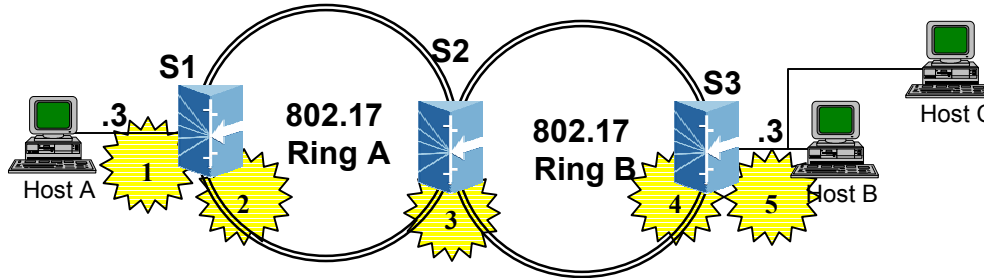

Case event
{ receive 802.17 Frame off Ring }
  /* Do 802.17 MAC specified packet reception logic */
  If ( Pass Frame to Bridge Relay )
    /* Build Service Indication Primitive */
    :
    If ( frame.PT == Single_Encap )
      { Single_Encap } -> Indication.EncapID
      Indication.DispatchToBridgeRelay()
    End If

  { Receive Service Request Primitive }
    Convert( Request.EncapID ) -> frame.PT
    :
  End Case

```

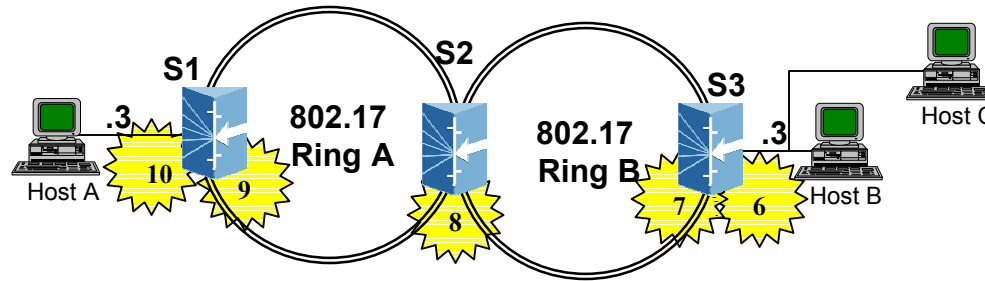

# Network Example #1: High Level Walk-Thru

Station S1 and S3 are configured to be Encapsulated Bridges. Station S2 is configured to be a Transparent Bridge (802.1D). Assume no DB learning has occurred.
