Maytum, Michael   Bourns, Inc.

Comment Type   **GR**   *Comment Status* **R**

The impulse value of 1.5 kV 10/700 is too low for the above reasons. Compliance only to the lower 1.5 kV 10/700 condition allows manufacturers to reduce insulation withstand voltage and potentially expose users to greater hazards.

SuggestedRemedy

Response   *Response Status* **W**
REJECT.

Comment makes reference to another comment and offers no solution. Contexually, this is a duplicate of comment 177 (the referred to comment) and therefore this comment is unneccessary.

I am unsure where to fix this, but, it appears to me that we have made all type 2 PDs managed devices and have triggered support for management for all clauses implemented by a Type 2 PD. This is, I believe, and unintended consequence of using LLDP for handshaking.

SuggestedRemedy

Not sure how to fix.

Response   *Response Status* **U**
REJECT.

discussed but no concensus, rejected by default

Some snips from offline discussions:

"So either we need to change IEEE 802.3at to match IEEE 802.3bc or IEEE P802.3bc to match IEEE 802.3at next week. If we decide to go with LLDP being a separate containment tree as IEEE P802.3bc is at the moment we have solved the above problem - if we don't we need to change the packages in IEEE P802.3at to allow LLDP to be separate from the other attributes."

"Since we voted to make 802.3at contingent on 802.3bc, I think we should change 802.3at to match 802.3bc. Otherwise we will have a mismatch. Also the attributes corresponding to the legacy Power TLV presently follow the containment in 802.3bc. So it makes sense to put all the attributes related to PoE within the same containment."

Draft D4.0 Note 1 page 19 line 51 says:
"NOTE 1-The value of the 100 ohm termination resistor can be adjusted to compensate for the test circuit resistance.
The test circuit resistance should exceed 2 kohm."
Following my objective of clarifying the text in order to reduce the amount of test conditions interpretations I have few questions that may be needed to be clarified:
1. What is "the test circuit resistance" which part of figure 25-1 is it?
Is it the PHI output resistance that determines Ibias?
If this is the intention then modify the text to be:
"NOTE 1-The value of the 100 ? termination resistor can be adjusted to compensate for the test circuit resistance which is defined as |(v1-v2)|/Ibias. The test circuit resistance should exceed 2 k?."
See attached "modified Figure 25-1" proposal for clarifying the issue.
2. The text " ..can be adjusted to compensate for ..": It is not clear why a compensation is required. If the intent is to adjust the 100 ohm in order to compensate the effect of the 2 2Kohm on the total equivalent termination resistance then modify the text to:
"NOTE 1-The value of the 100 ? termination resistor can be adjusted to compensate for the effect of the test circuit resistance which is defined as |(v1-v2)|/Ibias, on the total equivalent termination resistor. The test circuit resistance should exceed 2 k?."
See attached "modified Figure 25-1" proposal for clarifying the issue.

SuggestedRemedy
Group to clarify it.
My proposal is:
1. Add V1, V2 labels to Ibias terminals in Figure 25-1 (See attached drawing "modified figure 25-1".
2. Modify Note 1 text to be:
"NOTE 1-The value of the 100 ohm termination resistor can be adjusted to compensate for the effect of the test circuit resistance which is defined as |(v1-v2)|/Ibias, on the total equivalent termination resistor. The test circuit resistance should exceed 2 kohm."

Response   *Response Status* **C**
ACCEPT IN PRINCIPLE.

*** Comment submitted with the file 31476500024-Modifiedfigure25-1Rev003.pdf attached ***

Draft D4.0 (SA) Note 1 page 19 line 51 says:
(This comment is replacing other similar comment that I have sent on the subject)
"NOTE 1-The value of the 100 ohm termination resistor can be adjusted to compensate for the test circuit resistance.
The test circuit resistance should exceed 2 kohm."
Following my objective of clarifying the text in order to reduce the amount of test conditions interpretations I am suggesting to modify figure 25-1 for better clarity:
1. Mark were the PI starts and ends as we did in other drawings.
2. Add the label "Termination" near the 100 ohm resistor

SuggestedRemedy
Modify figure 25-1 for better clarity as follows (see attached file: modified figure 25-1 rev 003.pdf):
-Mark were the PI starts and ends as we did in other drawings.
-Add the label Termination near the 100 ohm resistor

IEEE P802.3bc defines a entirely relationship diagram for LLDP objects that is separate from the DTE and Repeater system entity relationship diagrams currently found in IEEE 802.3. Further, rather than defining a new TLV, IEEE P802.3at is extending the existing Power via MDI TLV so should extent the current MIB defined for that TLV.

SuggestedRemedy

Separate out the LLDP related attributes from the oPSE and oPD managed objects and move them to a modification to the IEEE P802.3bc defined oLldpXdot3LocSystemsGroup and oLldpXdot3RemSystemsGroup managed objects.

Response　　　　　　　*Response Status*　**W**

ACCEPT IN PRINCIPLE.

Move the entire current PD attributes to be the PD LLDP objects. Move the entire current LLDP related PSE attributes to be the PSE LLDP objects. Make other related editorial changes to coordinate with IEEE P802.3bc D2.0.

Law, David   3Com

Comment Type **T**   *Comment Status* **A**
In IEEE Std 802.3af the similar figure for the Midspan PSEs made it clear that power was only supplied from the PSE to the PD - this was simple since the 'spare pairs' we 'broken' in the PSE and only the ones connecting to the PI were powered. Now in the case of IEEE 802.3at Midspans, the use of transformer coupling or other techniques, allows power to be supplied on the 'data pair' if desired. I however still think there is merit to indicate in this figure that power is only sourced in the direction of the PI so an initial reader will capture this concept from the diagram.

SuggestedRemedy
Suggest that the two vertical lines connecting the PSE box in the Midspan to the wire be changed to curved lines curving in the direction of the PI - or alternatively use something similar to the bus rippers symbol found in schematics - after all we are only powering half of the 8 wires in the 'bus'.

The paragraph does not make proper sense, specifically the phrase "or both" does not in light of the second sentence unless the PSE is intended to have multiple link segments.

SuggestedRemedy

Should read "A PSE shall implement Alternative A or Alternative B. While a PSE may be capable of both Alternative A and Alternative B, PSEs shall not operate both Alternative A and Alternative B on the same link segment simultaneously." A PSE can not truly 'implement' something it is prohibited from 'operating.'

Response   *Response Status* **C**

REJECT.

This is legacy text. The change would prevents a PSE from providing one of two alternatives.

Cl **33**   *SC* **33.2.4**   *P* **50**   *L* **34**   # 87

Vetteth, Anoop   Cisco Systems, Inc.

Comment Type **TR**   *Comment Status* **A**   *pics*

The default value of ted_timer_done should be "Done". If the default value is "Not_Done" it will not permit power-on for any port under normal operating condition until the first fault is encountered (which ironically can never happen). This branch from CLASSIFICATION_EVAL to POWER_DENIED will be taken and so power will always be denied.

SuggestedRemedy

Add to the definition of ted_timer on page 48: "The default state of this timer is ted_timer_done"

Response   *Response Status* **C**

ACCEPT.

The criterion "power_applied" is used only with legacy_powerup. New criterion "!current_limiting" is used with new definition for inrush. The definition for power_applied says that the "PSE has begun steady state operation ...... completed ramp of voltage and is operating beyond the POWER_UP requirements of 33.2.9.6". All these should apply for new inrush definition also. Moreover all the timers on page 52 are initialized when "power_applied" is asserted. Per the SM on page 50, the PSE can reach the POWER_ON state even when "power_applied" is not asserted. This is most certainly a bug.

SuggestedRemedy

Add to the definition of "power_applied" on page46 : ".... completed ramp of voltage, is not in current limiting state and is operating beyond......"; Change the transition condition from POWER_UP to SET_PARAMETERS to: [(tinrush_timer_not_done * legacy_powerup) + tinrush_timer_done] * power_applied * tpon_timer_not_done * (PSE_TYPE = 2); Change the transition condition from POWER_UP to POWER_ON to: [(tinrush_timer_not_done * legacy_powerup) + tinrush_timer_done] * power_applied * tpon_timer_not_done * (PSE_TYPE = 1); Change the transition condition from POWER_UP to POWER_ON to: tinrush_timer_done*[legacy_powerup + !power_applied + (Iport >= Iinrush)]; Remove current_limiting definition from page 45

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add to the definition of "power_applied" on page46 : ".... completed ramp of voltage, is not in current limiting state and is operating beyond......"; Change the transition condition from POWER_UP to SET_PARAMETERS to: [(tinrush_timer_not_done * legacy_powerup) + tinrush_timer_done] * power_applied * tpon_timer_not_done * (PSE_TYPE = 2);

Change the transition condition from POWER_UP to POWER_ON to: [(tinrush_timer_not_done * legacy_powerup) + tinrush_timer_done] * power_applied * tpon_timer_not_done * (PSE_TYPE = 1);

Change the transition condition from POWER_UP to ERROR_DELAY to: tinrush_timer_done*[legacy_powerup + !power_applied + (Iport >= Iinrush)]; Remove current_limiting definition from page 45

Instruct the editor to adjust the PICs to match these changes.

Dtaft D4
The wording of "Using only this PI voltage information
is insufficient" is confusing.
Discussion:
If it "is insufficient" as the text says then why we allow it? it may cause interoperability problems...
The reason why we allow it is to continue to support legacy which work fine so using the wording "is insufficient" tells the reader that we know for a fact that in all cases that this method is used it is not working which is also not true.

SuggestedRemedy
Change "is insufficient" to
Option a) : "may be insufficient"
Option b) : "in some cases is insufficient"
Option c) : "in some cases may be insufficient"
Option d) : Other equivalent wording..

Draft D4
1. do_short_detect function detects short circuit condition and not overload condition. So
we need to fix the text (it was copied from do_overload_detect..)
2. However overload condition may be many scenarios that is ended with "short circuit"
condition from the PSE point of view examples:
1. Very high load that corresponds to very low output resistance load < 1 ohms.
2. Overload that corresponds to current > Icut_max
All of the above may be considered as overload conditions or "short circuit" condition from
the PSE point of view.
I belive that short circuit doesn't mean zero ohms.
As a result do_short_detect function detects short circuit and overload as well. In this case
is very much depends on system specific implementation. (All short circuits are overload as
well but not all overload scenarios are short circuit conditions. It depends by the PSE
output impedance as well. The difference between do_short_detect and
do_overload_detect is a) the time TLIM or TOVLD b) Current thresholds c) Enforcement d)
different states which requires two separate functions)

SuggestedRemedy

Change from:
"do_short_detect
This function monitors the PSE output current and detects an overload condition for TLIM
within a sliding window."
To:
"do_short_detect
This function monitors the PSE output current and detects a short circuit condition or an
overload condition for TLIM within a sliding window."

(All short circuits are overload as well but not all overload scenarios are short circuit
conditions. It depends by the PSE output impedance as well. The difference between
do_short_detect and do_overload_detect is a) the time TLIM or TOVLD b) Current
thresholds c) Enforcement d) different states which requires two separate functions)

Response   *Response Status* **C**

Landry, David   Silicon Laboratories

Comment Type **TR**   *Comment Status* **A**   *pics*

There is a copy-paste error in the first sentence of the do_short_detect function description.
The function does not detect an overload condition only; it detects a short circuit (and by
extension, an overload) condition.

SuggestedRemedy

Change " ... detects an overload condition ..." to "... detects a short cicuit condition or an
overload condition ..."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This draft considers a PSE PI supplying more than Pclass to be in overload, when the PI is
in current limit, the port is considered to be in a short circuit condition. Therefore, when the
port is in current limit, both a short circuit and an overload condition exist. However, a
function designed to detect a short should not be asserted when only an overload condition
exists.

The function is used to monitor a short.

Change " ... detects an overload condition ..." to "... detects a short circuit condition ..."

See 237, 4, 41

Draft D4
If the result of the do_short_detect function is TRUE, it doesn't necessarily mean that the
PSE has detected a current limit condition which is true only to a specific implementation.
The PSE may detect TRUE condition by only detecting that the current pass some
threshold without activating current limit circuitry which is allowed by figure 33-15.

SuggestedRemedy

Change from:
"Values:
TRUE: The PSE has detected a current limit condition.
FALSE: The PSE has not detected a qualified current limit condition."
To:
"Values:
TRUE: The PSE has detected a short circuit condition.
FALSE: The PSE has not detected a qualified short circuit condition.
Short circuit current is defined as any current above Ipeak as illustrated in figure 33-15"

The transition from IDLE to START_DETECTION, the transition from TEST_MODE to
IDLE, and the transition from TEST_ERROR to IDLE all contain the qualifier
(mr_pse_enable != force_power). This could technical be true if (mr_pse_enable = enable)
or (mr_pse_enable = disable). However, the state (mr_pse_enable = disable) triggers an
unconditional entry into the DISABLED state. Therefore, the only meaningful value for the
statement (mr_pse_enable != force_power) is actually (mr_pse_enable = enable).

SuggestedRemedy

Change occurrences of (mr_pse_enable != force_power) to (mr_pse_enable = enable).
This has the added benefit of being easier to follow in the state diagrams.

Response   *Response Status* **C**

p52, 12. The state diagram and text of 33.2.11.1.2, line 14 do not match.
Text states "... Iport is greater than or equal to Imin max for at least Tmps every Tmps +
Tmpdo..."
The state diagrams tests that the signature is invalid for at least Tmpdo before power is
removed. It does not test that a valid signal has been present for at least Tmps.
The PD spec. on page 81, line 41 requires at least 10 mA for 75 ms.

SuggestedRemedy

Interoperability requires that a PD draw at least the holding current for at least the PSE
hold time minimum.
Replace p67, line 14, "... Iminmax for at least Tmps every Tmps+Tmpdo, ..." with
"... Iminmax continuously for at least Tmps every Tmps + Tmpdo, ..."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Replace p67, line 14, "... Iminmax for at least Tmps every Tmps+Tmpdo, ..." with
"... Iminmax continuously for at least Tmps every Tmps + Tmpdo, ..."

Instruct the editor to adjust the PICs to match these changes.

Instruct the editor to combine this comment and 149, then adjust the PICs to match these
changes.

P67, 6 requires Ihold (Iminmax) for at least TMPS to be considered valid.

P67, 7 the MPS is absent when port current is less than Ihold (Iminmin).

P67, 8 the MPS is either present or absent when within Ihold (Iminmin to Iminmax).

P45, 28 mr_mps_valid asserts when port current exceeds Ihold for at least TMPS.

p52, 3 the state diagram moves from MONITOR_MPS to DETECT_MPS when the MPS is
not valid (Iport < Ihold). It moves from DETECT_MPS to MONITOR_MPS only when Iport
> Ihold and this has been true for at least TMPS.

Law, David   3Com

Comment Type **TR**   *Comment Status* **A**   *pics*

The Overload state diagram is held in the IDLE_OVLD state when power is not applied (power_applied = false) , the moment power is applied (power_applied = true) it transition to the MONITOR_OVLD state when the do_overload_detect function is called once - see 21.5.1 'Actions inside state blocks' which states 'After performing all the actions listed in a state block one time, the state block then continuously evaluates its exit conditions until one is satisfied, at which point control passes through a transition arrow to the next block. While the state awaits fulfilment of one of its exit conditions, the actions inside do not implicitly repeat.'.

So the do_overload_detect function is called once after power_applied becomes true then never again - hence should an overload occur some time after power_applied becomes true it will not be detected - this doesn't appear to be the intended behaviour. The same is also true for the Short state diagram.

The simplest fix, assuming the timers that these two state diagrams used to provide are no longer required, is to define ovld_detected and short_detected as variables and delete the two state diagrams.

SuggestedRemedy

[1] Delete the Overload and Short state diagrams.
[2] Delete the do_overload_detect and do_short_detect functions
[3] Define ovld_detected and short_detected as variables
ovld_detected:
A variable indicating if the PSE output current has been in an overload condition (see 33.2.9.7) for at least Tovld of a one second sliding time.
Values: TRUE: The PSE has detected an overload condition.
FALSE: The PSE has not detected a qualified overload condition.
short_detected:
A variable indicating if the PSE output current is in a short circuit condition (see 33.2.9.8).
Values: TRUE: The PSE has detected a current limit condition.
FALSE: The PSE has not detected a qualified current limit condition.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This removes two simple state diagrams and provides the intended functionality.

[1] Delete the Overload and Short state diagrams.
[2] Delete the do_overload_detect and do_short_detect functions
[3] Define ovld_detected and short_detected as variables

ovld_detected:
A variable indicating if the PSE output current has been in an overload condition (see 33.2.9.7) for at least Tovld of a one second sliding time.
Values: TRUE: The PSE has detected an overload condition.
FALSE: The PSE has not detected a qualified overload condition.

---

short_detected:
A variable indicating if the PSE output current is in a short circuit condition for TLIM within a sliding window (see 33.2.9.8).
Values: TRUE: The PSE has detected a current limit condition.
FALSE: The PSE has not detected a qualified current limit condition.

Patoka, Martin   Texas Instruments

Comment Type **E**   *Comment Status* **A**   *pics*

The PSE measures the link segment (per 33.2.7.1), however the text states is is measuring the PD.

SuggestedRemedy

Add a sentence similar to "The PSE PI is connected to a PD through a link segment, however in the following sections, the link is not called out to preserve clarity."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add sentences after line 44, "The PSE PI is connected to a PD through a link segment. In the following sections the link is not called out to preserve clarity."

---- Additional input from the commentor ----
The PSE is connected to a link section, which may or not have a terminating PD. P55L3 says this.
However, P52L43 states that the PSE is powering a PD - yes but when connected through a link segment.
This follows through the next paragraph. Also at P53L4.

My suggestion was to introduce the concept that the PSE sees maybe a cable & maybe a PD, but the PD always through a cable.
Then when the rest of sections refer only to PD, it will be implicitly stated that it is through the link segment.
---- end

Draft D4
We can define only parameters that are measurable at the PI.
E.g. we can not define behaviour of power supply or other circuits inside the PSE or PD.
See multiple locations in the spec that explicitly state this concept.
Similarily when PSE is evaluating the presentce of valid PD as stated in line 50, it is done
by at least two measurements with Vport and not with Vdetect.
Vdetect is internal variable. Vport is the variable which we have access to it.
It is true that Vport is function of Vdetect but Vdetect is not a variable that is define in one
of the tables in the spec.
As aresult Vdetect should be Vport.

SuggestedRemedy

1. Delete Vedetect from figures 33-12 and 33-13 and leave the DC supply part unlabeled if
it is permitted by the rules.
2. In line 50: Replace "Vdetect" with "Vport"

Response   *Response Status*   **C**

ACCEPT IN PRINCIPLE.

1. Delete Vdetect from figures 33-12 and 33-13 and leave the DC supply part unlabeled.

2. In line 50: Replace "Vdetect" with "Vport"

See 46.

Instruct the editor to adjust the PICs to match these changes.

The NOTE is not very good advice. If one always waits for the voltage at the port to settle, then it may be difficult to weed out PDs with an invalid detection signature due to excessive capacitance.

SuggestedRemedy

Since the note may not be a good idea, and its not normative, and we really shouldn't have to hand-hold implementors on how to make voltage/current measurements -- delete it.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Replace the note with:
NOTE-Settling time before voltage or current measurement: the voltage or current measurement should be taken after VPSE has settled to within 1 % of its steady state condition for a PD detection signature connected as specified in Table 33-14.

A worst-case PSE detection range with maximum capacitance and maximun Rvalid value will settle to a final value in k x 0.15 x 26500 = k x 4 ms maximum.

When an invalid capacitor is used, the time constant becomes 10/0.15 = 67 time longer.

This note was added to help ensure that adequate settling time was provided for detection. Many network devices that are not PDs have resistors and capacitors on their MDI connections. Short settling times during detection may result in a false positive.

See 239.

Table 33-5. Vos and Ios are not defined, while Vos is only useful for PSE design. Ios is meaningless. Since they have been undefined since 2005, they are not necessary.

SuggestedRemedy

Move Vos to Table 33-4, add comment "PSE must accommodate a PD with rectifier offset to Vosmax.", Delete Ios from Table 33-5.

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

Reviewed without concensus. Jeff and Yair to talk offline.

Vos, and Ios have caused too much discussion and provide little benefit.
The specification will be easier to understand if these terms are eliminated.
Interoperability is maintained because a PSE shall provide Vvalid when driving a
PD, and a PD provides Rvalid when driven with this voltage range.
This works because the PSE provides more than Vos and supplies enough
current to drive Rvalid, and the PD provides Rvalid and takes into account
its bias requirements for the operating voltage range.

Rdetect is a dynamic resistance. Some PSE detection circuits use a current source.
This requires a PD to provide a valid signature at a reasonable current.
The minimum value could be interpreted to be the PSE Ios of 12 uA.
I believe a value of 50 uA would work with all devices I am aware of
and this provides more PD design margin.

Delete all references to PSE and PD Vos and Ios.
Remove Figure 33-19 and references to it.
Add parameter Ivalid to Table 33-14 with the same conditions as that table Rdetect. The minimum current is 12 uA.
Add a sentence to page 73, line 35, "Rdetect shall result when at least Ivalid current is sunk by the PD PI."

The Editor should use their discretion to cleanup text.

Instruct the editor to adjust the PICs to match these changes.

Draft D4.0 (SA)
We require PSE to maintain Vmark prior to Startup for Type 2 system.
If during Mark event 2 or even park event 1 PD was disconnected for a short period of time
(e.g. less than 300msec ...) the PD lost its memory and will be powered as class 0 even if
PSE did what he was required and disconnect time was less than 300msec
Discussion:
In Type 1 system this case is fully defined.
t<300msec : system operates
300 - 400msec : may or may not disconnected
>400msec : must be disconnected.
Here the problem in Type 2 is for t<300msec which meets disconnect criteria i.e. power
should be on per the classification results BUT classification results were lost as PD was
disconnected...

SuggestedRemedy

To instruct the editor add the following text to 33.2.8 at the relevant location:
"The behaviour of A Type 2 PD that was disconnected from a Type 2 PSE during Mark
event is undefined and out of scope of this standard"

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

It is already undefined and out of scope. There is no need to enumerate all the things
undefined and out of scope.

DRAFT D4.0 (SA), the note in lines 25-26:
The text:
"NOTE: In a properly operating system, the port may or may not discharge to the VMark
range due to the combination of channel capacitance and PD current loading."
is not fully acurate due to the fact that it is not only the function of the channel capacitance.
It is also a function of the PD capacitance.

SuggestedRemedy

Change from:
"NOTE--In a properly operating system, the port may or may not discharge to the VMark
range due to the combination of channel capacitance and PD current loading."
To:
"NOTE--In a properly operating system, the port may or may not discharge to the VMark
range due to the combination of channel and PD capacitance and PD current loading."

(The minimum PD capacitance during detection and classification (Table 33-14 =0.05uF) is
at least 5 times higher that the channel capacitance so the channel capacitance is only
20% of the minimum system capacitance at the above operating mode.)

Response   *Response Status* **C**

ACCEPT.

Landry, David   Silicon Laboratories

Comment Type **E**   *Comment Status* **A**

The last paragraph on the page should mirror the language of the similar behavior for 1-
Event classification.

SuggestedRemedy

Instead of "... the PSE assumes the PD ..." should be "... the PSE treats the PD as a Type
1 ..."

Response   *Response Status* **C**

ACCEPT.

Cl **33**   *SC* **33.2.8.2**   *P* **59**   *L* **19**   # 140

Schindler, Frederick   Cisco Systems, Inc.

Comment Type **ER**   *Comment Status* **A**

p59, 19. A PSE physical layer classifies by measuring Iclass. When the class current
measured is
in between two valid class ranges the PSE may report the classes that is on either side of it.
When a PSE does not measure class current or chooses not to use this measurement it
may report
class 0--the default class.
Placing Class 0 within table 33-9 may confuse the reader.
Note that a Type 1 PSE could also ignore valid class current and report class 0.

SuggestedRemedy

Remove "May be Class 0," in the classification column of table 33-9 except for the case
when
Iclass is >5.00 mA and < 8.00 mA, and replace the removed text with "May be."
Add a note below table 33-9 that states,
"Note: A Type 1 PSE may ignore Iclass and report class 0."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Good catch. The addition of 'Class 0' to the guardbands disregards the fact that the PSE
can assign Class 0 even if it measures Class 1, 2, 3. To be complete every entry in the
Classification column shuold have 'Class 0' first, but of course that would be silly. Better to
remove the extraneous Class 0 options.

Remove "May be Class 0," in the classification column of table 33-9 except for the case
when Iclass is >5.00 mA and < 8.00 mA, and replace the removed text with "Either Class"
(effectively, delete '0,' in three places and '0 or' in one place). After 'Class 4' on last line
add "or invalid class'.
Add a note below table 33-9 that states,
"Note: A Type 1 PSE may ignore Iclass and report class 0."

Darshan, Yair   Microsemi Corporation

Comment Type   **GR**   *Comment Status*   **D**   *pics*

Draft D4.0 Table 33-11 items 1,6,7
When I reviewed the PSE and PD specifications during startup, I have noticed that there is
a big difference between the energy dissipated at the PD per Table 33-18 items 1,5 and
50msec (PD spec) and what is specified for The PSE spec in Table 33-11 items 1,6,7 at
the same time.
Example:
PD worst case numbers: 0.4Ap, 0.05sec, Vport 36V to 57V.
Cable: 0.4A to 0.45A for 0.05sec to 0.075sec, Rch=20 ohms.
If we add the energy dissipated in PD and Cable and compare it to the PSE numbers (44V-
57V, 0.4A to 0.45A, 0.05s to -.075sec) we get huge difference which can never be used but
hence not a cost effective requirement.
In order to solve this we can just add simple text at the PSE part during power up which
requires that POWER_UP parameters shall be tested with a PD load that meets the above
PD parameters per Table 3-18 specifications.

SuggestedRemedy

Add the following text at 33.2.9.6 after line 40:
"The specifications for Iinrush and Tinrush shall be met when PSE is connected to a load
that meets Table 33-18 items 1,2,9 and 33.3.7.3."
or better text.

Proposed Response   *Response Status*   **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

The heat dissipated during inrush:
Vpse < 10 V, 10 mA
10 V < Vpse < 30 V, 60 mA
30 V < Vpse < 57 V, 400 mA

Vds = 57 - Vpse
Note that as the current requirement increase, Vds decreases.

In the worst-case where 0 to 30 V occurs in 0 time:

(57 - 30) x 0.4 x 0.05 = 0.54 J

The worst-case system is:

A PD that has 180 uF and is drawing some power.

If a PD is just a 180 uF cap. then it takes 180 x 20 x 4 = 14.4 ms to charge up.

The excess power is used to power the PD.

Landry, David   Silicon Laboratories

Comment Type **TR**   *Comment Status* **A**   *pics*

The use of "Vport" should be discontinued. There are 4 quantities of interest: (1) the static output voltage of a PSE, (2) the static output voltage of a PD, (3) the instantaneous measurement of the voltage at the PSE's PI, (4) the instantaneous measurement of the voltage at the PD's PI. We have already named (2) VPort_PD, and (3) VPSE. We should call (1) VPort_PSE, and (4) VPD. This eliminates any ambiguous use of "VPort"

SuggestedRemedy

Change Table 33-11 item 1 to "Vport_PSE" and use this term whenever referencing this variable. Change all occurrences of Vport to VPSE or VPD as needed to refer to the instantaneous port voltage of the relevant PI.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Perform suggested remedy.

Also, adjust PICS as needed.

Cl **33**   *SC* **33.2.9**   *P* **60**   *L* **16**   # 49

Landry, David   Silicon Laboratories

Draft D4.0
Table 33-11 item 15, additional information column:
The spec requires that Trise will be measured from 10% to 90% of Vport however Vport is
a parameter that is defined in Table 33-11 item 1 which is a number from 44V to 57V for
Type 1 and 50 to 57V for type 2.
Due to the fact that the specification refer to Trise which is the entire port voltage transition
from its minimum value to its maximum valuse and not to 10% or 90% of 44V to 57V which
is Vport, the spec requires some clarification.
The correct definition is "From 10% to 90% of the entire port voltage range during turn on at
POWER_UP state" or equivalent wording to correct the above error.

SuggestedRemedy
Change the text in the "additional information" column from:
"From 10% to 90% of Vport"
To: "From 10% to 90% of the entire port voltage range during turn on at POWER_UP state"

(This change fix the problem in a way that allows port voltage range to be from:
a) 0V to Vport (Vport as specified in Table 33-11 item 1)
b) Voff to Vport (Voff is specified in Table 33-11 item 17)
c) Vmark to Vport
d) Vclass to Vport
e) Any minimum voltage at the port to Vport

Response   *Response Status* **C**
ACCEPT IN PRINCIPLE.

Change the text in the "additional information" column from:
"From 10% to 90% of Vport"

To: "From 10% to 90% of the voltage difference at the PI in POWER_ON state from the
beginning of POWER_UP"

Darshan, Yair   Microsemi Corporation

Comment Type **ER**   *Comment Status* **R**   *pics*

Draft D4.0 (SA):
33.2.9.6 Defines the conditions required to meet the specifications for Iinrush but are not
addressing the conditions for meeting Tinrush as well.
Tinrush minimum is 50msec which was originally calculated as long as Iinrush (0.4A to
0.45A) is kept at any port voltage from zero to Vport.
If implementer uses items (d) and (e) for Foldback current limit implementation in which
PSE is allowed to supply Iinrush=60mA minimum (and not 0.4 to 0.45A) as long as
10V<=Vport<=30V as Tinrush may result with much higher time duration >75msec which is
not permitted.
Example:
If the PD input capacitor is 150uF and PSE uses Iinrush=60mA from 0V to 30V and 0.4A
from 30V to 57V, We get Tinrush=150uF*(30V/0.06A + (57V-
30V)/0.4)=85ms>75msec.(After 75msec, port must turn OFF).
It became worse with higher capacitors value which also supported by this specifications.
So the question is: What are the conditions in which Tinrush should be tested.
It is obvious that it is the same conditions as Iinrush is tested i.e. the minimum requirement
for the PSE is to test Iinrush and Tinrush from 30V to Vport if implementer chooses to
implement 33.2.9.6 (d) and (e).

SuggestedRemedy

Suggested Remedy:
Replace the text of line 42:
"The specification for IInrush in Table 33-11 shall be met under the following conditions:"
With:
"The specification for Iinrush and Tinrush in Table 33-11 shall be met at initial port voltage
of at least 30V and under the following conditions:"

It means that pending the implementation being used it can also be met at port voltage
from 0V to Vport but this is not the minimum requirement.

Response   *Response Status* **U**
REJECT.

REJECT.

Discussed and could not come to consensus. Default action is to reject.

Cl **33**   *SC* **33.3.2**   *P* **69**   *L* **52**   # 174
Beia, Christian   STMicroelectronics

Comment Type   **TR**   *Comment Status*   **A**   *PD General*
The first description of PD Types is related to 1-event or 2-event classification. This is not wrong, but neither the main feature. The real distinction is the maximum drawn power.

SuggestedRemedy
Add a sentence as the following: PDs that expect to draw from the PSE a maximum power up to 13W are known as Type1. PDs that expect to draw from the PSE a maximum power up to 25.5W are known as Type2.

Response   *Response Status*   **C**
ACCEPT IN PRINCIPLE.

add to the end of sentence at P69, L51: "The main distinction between Type 1 and Type 2 PDs is the maximum permissable power draw."

change text:
From:
"Type 1 PDs implement 1-Event Physical Layer classification."

"Type 2 PDs implement both 2-Event Physical Layer classification (see 33.3.5.2) and Data Link Layer classification
(see 33.6)."

To:
Type 1 PDs implement a minimum of 1-Event Physical Layer classification and advertise hardware class 0-3.

Type 2 PDs implement both 2-Event Physical Layer classification (see 33.3.5.2) and Data Link Layer classification (see 33.6) and advertise hardware class 4.

Cl **33**   *SC* **33.3.2**   *P* **69**   *L* **53**   # 175
Beia, Christian   STMicroelectronics

Comment Type   **T**   *Comment Status*   **A**   *PD General*
As per permutation table 33-8 a Type 1 PD is allowed to show a 2-event class signature.

SuggestedRemedy
Change the sentence to: Type 1 PDs implement 1-Event or 2-Event class signature.

Response   *Response Status*   **C**
ACCEPT IN PRINCIPLE.

OBE 174

Cl **33**   *SC* **33.3.2**   *P* **70**   *L* **1**   # 176
Beia, Christian   STMicroelectronics

Comment Type   **E**   *Comment Status*   **R**   *PD Class*
By definition, PDs implement Class signature and not classification (The definition for 1 or 2-Event classification is the application of a class event) so the sentence is inaccurate

SuggestedRemedy
Replace "Type 2 PDs implement 2-Event Phisical Layer Classification" with "Type 2 PDs implement 2-Event class signature"

Response   *Response Status*   **C**
REJECT.

This is a matter of symantics. There is a protocol (voltage qualification or qualification and sequential state machine) associated with providing multiple signatures. The usage of "classification" implies both the protocol and the actual signature.

Draft D4.0
The "Note" in line 1:
"NOTE - DO_CLASS_EVENT3 creates a defined behavior for a Type 2 PD that is brought
into the classification range repeatedly."
We need to clarify how PD is brought to such scenario i.e. this is not due to the PD
operation.

SuggestedRemedy

Append the text "by the PSE." to the end of line 2 on page 73 so the new text will be:
"NOTE--DO_CLASS_EVENT3 creates a defined behavior for a Type 2 PD that is brought
into the classification range repeatedly by the PSE."

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

While the recommended statement would not be incorrect, the basis of the standard is
always that the PSE drives the link voltage, the PD drives the link current unless a special
or fault condition occurs. That is, the PD does not back-drive the PI. Adding un-necessary
words needlessly complicates the standard.

Cl **33**   *SC* **33.3.3.5**   *P* **73**   *L* **1**   # 21

Darshan, Yair   Microsemi Corporation

Comment Type **GR**   *Comment Status* **D**   *PD State Machine*

Draft D4.0 (SA)
The "Note" in line 1:
"NOTE--DO_CLASS_EVENT3 creates a defined behavior for a Type 2 PD that is brought
into the classification range repeatedly."
DO_CLASS_EVENT3 should be DO_CLASS_EVENT_n due to the fact that
DO_CLASS_EVENT3 will happen when PSE is going to startup and passing classification
range once and when PD is passing Voff, Port voltage may drop to any value down to
Vmark_min and voltage will ramp again (PSE is charging PD input capacitance) while
crossing classification operating range hence DO_CLASS_EVENT4.
So for the general case we need to replace NOTE--DO_CLASS_EVENT3 with NOTE--
DO_CLASS_EVENT_n while n is the number of ocassions when Vport is passing through
classification range as a result of PSE - PD interactions.

SuggestedRemedy

1. Replace:
"NOTE-DO_CLASS_EVENT3 creates a defined behavior for a Type 2 PD that is brought
into the classification range repeatedly."
With:
"NOTE-DO_CLASS_EVENT_n creates a defined behavior for a Type 2 PD that is brought
into the classification range repeatedly (n times) by the PSE."
2. Update Figure 33-18 line 42, DO_CLASS_EVENT3 label
Alternatively, group to show how the above case is covered by the current state machine,
Figure 33-18.

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

The existing DO_CLASS_EVENT3 permits multiple cycles.

The transient behavior of the link is not incorporated in the state machine - Vport_PD is
defined as a static value. Thus there is no need to create a lot of extra states.

Comment Type **E**   *Comment Status* **D**   *PD State Machine*

The NOTE is redundant, as the Tclass variable in itself establishes the concept that it takes time to settle on a class signature.

SuggestedRemedy

Strike the NOTE.

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

This was put into the standard to address the need for the voltage to transition through the class range, but not the need for the PD to respond to it during the transition to operating voltage.

Cl **33**   *SC* **33.3.4**   *P* **73**   *L* **37**   # 76
Landry, David   Silicon Laboratories

Comment Type **E**   *Comment Status* **A**   *PD Detection*

The paragraph talking about signature guardbands and a PD that presents a non-valid signature being a non-valid PD is unnecessary.

SuggestedRemedy

Strike the paragraph.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Tables 33-14 and 33-15 present Valid and Invalid signatures. There are signatures that correspond to either.

"The valid and non-valid detection signature regions are separated by guardbands. The guardbands for the slope are the ranges 2.0 kO to 23.7 kO and 26.3 kO to 45.0 kO. A PD that presents a signature in a guardband
is non-compliant."

Maintain the intent comment changing the paragraph to:

A PD that presents a signature outside Table 33-14 is non-compliant, while a PD that presents the signature of Table 33-15 is assured to fail detection.

*** Comment submitted with the file 30634700024-VmarkvsImarkattypicalconditions.pdf attached ***

Draft D4.0 Table 33-17 items 3 and 4:
Possible interoperability issue:
A PSE is allowed to have up to 0.52uF in its output.
Cable capacitance is 10nF max for 100m.
PD capacitance during detection in 0.12uF max.
PD capacitance during classification is undefined. (Worth seperate comment..)
Hence total capacitance is 0.65uF at least for the worst case.
During Mark Event PD current can be as low as 0.25mA.
During Vmark_th range the current can be any number between 0.25mA to 44mA or to Iclass.
Assuming PD vendor use 0.25mA all the way for Vmark_th range then the voltage at the port during Mark event for TCLE1/2_min=6msec will be:
Vclass-0.25mA*6msec/0.65uF= Vclass-2.304V.
1. Now if Vclass is 20.5V than port voltage at mark event of 6msec is 18.2V so PD can not identify the 2nd class event.
2. If Vclass is 18V (Middle range of Vclass) than port voltage at mark event of 6msec is 15.8V so again PD can not identify the 2nd class event.
3. If Vclass is 14.5V (lower range of Vclass) than port voltage at mark event of 6msec is 12.2V which MAY be Identified by the PD only if PD Vmark_th is lower than 12.2V...
So we have the following problems:
a) PSE can not support its maximum capacitance spec.
b) PSE can not support TCLE1/2 min value with (a)
c) The worst case scenario is: PD is using Vmark_th_min=10.1V ,Cpd=0.12uF, Imark=0.25mA for the entire Vmark_th range. PSE is using 0.52uF max, TCLE1/2=6msec.
At these conditins system is broken.
If we use typical numbers i.e. middle range numbers such:
PSE: 0.2uF , TCLE1/2=9msec, Vclass=18V.
PD: 0.1uF , Imark=0.25mA for the entire Vmark_th range, Vmark_th=10.2V (legal..PSE can not control what PD will use)
Then the voltage at the port during Mark event for TCLE1/2_min=9msec will be:
Vclass-0.25mA*9msec/0.3uF= 18V-7.5V=10.5V. This case will not work too.
See attached simulation results "Vmark vs Imark at typical conditions" file.
Conclusions:
We dont want to change legacy parameters but we can do simple change that will fix the issue: To require PD to consume Iclass as long as Vport>Vmark_th.

SuggestedRemedy

Add the following item after item 4 in Table 33-17:
Item: 4.1, Parameter: Mark_event threshold current, Symbol:Imark_th, Units:mA,
Min:Iclass, Max:Iclass_max, Additional Information: For Vclass >=Vport_PD >=Vmark_th

This comment was WITHDRAWN by the commenter.

The comment incorrectly assumes a PD will draw mark current in the classification voltage range. A PD will draw class current until it hits the lower threshold (something less than 14.5V) at which point it will start to draw mark current - but the PD has switched from the Class Event to the Mark Event, so it already knows that it is in the Mark State.

"To require PD to consume Iclass as long as Vport>Vmark_th"

This is not necessary as the PD internals will inherently distinguish the class/mark thresholds as it switches its loading to meet the existing voltage/current requirements. The existing PD requirements guarantee that it has self-aligning class/mark detection thresholds.   The presence of the loop resistance requires the PD to have some hysteresis - although not explicitly called out, it is required.

*** Comment submitted with the file 30204700024-
MinorProblemwithPDResetThresholdandResetVoltage.pdf attached ***

VReset_th Minimum was changed between draft 3.1 and 3.3 and appears to be in error
(From Clay Stanford). See attached File "Minor Problem with PD Reset Threshold and
Reset Voltage.pdf"

SuggestedRemedy

Old VReset_th Min. Value: 2.7 V
New VReset_th Min. Value: 2.8 V

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

P75, L43 change Min entry for T33-17, Item 5 to 2.81V and change Max entry for T33-17,
Item 6 to 2.81V.

This change was made by comment 100 against D3.1. Comment follows:

The VReset_th min and VReset max should correspond with the minimum detection
voltage, as this threshold dictates when the PD transitions out of detection into the
NOT_MDI_POWERED state.

Otherwise, it is possible for a PD to see a valid detection voltage, but churn through the
states because of the VReset and VReset_th overlap.

Sugg remedy: Make both VReset max and VReset_th min 2.7V.

Response: ACCEPT.

We need to limit the time required to PD current to get to Imark from Iclass otherwise the
PSE may be in overload if the PSE sets its current limit from Iclass_lim to Imark_lim faster
than PD current gets to Imark range.

SuggestedRemedy

1. Change the text from:
"When the PD is presenting a mark event signature as shown in the state diagram of
Figure 33-18, the PD shall draw IMark as defined in Table 33-17 and present a non-valid
detection signature as defined in Table
33-15."
To:
"When the PD is presenting a mark event signature as shown in the state diagram of
Figure 33-18, the PD shall draw IMark within Tmark_st as defined in Table 33-17 and
present a non-valid detection signature as defined in Table
33-15."
2. Add the parameter Tmark_st to Table 33-17 with the following data:
Item 3.1
Parameter: Imark stabilization time
Symbol: Tmark_st
Units: Min=0, Max=1msec (Yair:the number is a proposal, can be other practical number to
be determined by PD vendors)
Additional Information column: See 33.3.5.2.1
3. Add the following text line 52 PAGE 75:
Tmark_st is the time from Vmark_th to the time when Imark is within its operating range.

Proposed Response   *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

Since the PSE is assumed largely a sourcing device (implicit in the large time to discharge
the port in idle state) and since it was not our intention to mandate a discharge function in
the PSE, you can assume the PSE turns his port regulation to Vmark @ I mark in advance
of the voltage actually entering this region.

The PD requirement for mark voltage makes no exception for "just a short time" it is
absolute. The standard requires only Imark within the Imark voltage range. No change is
required.

From a practical standpoint, the standard is not requiring an infinitely fast PD detector - a
practical one is possible. The PD can switch (or begin to) anywhere between Vclass min
and Vmark max, and in addition it has margin down to 6.9V. So it has up to 10 us (dv/dt =
40mA / .1uf = 400e3V/s or .4V/us) to detect and turn off Iclass (assume 4V transition

Von is 42.0V. Vport_pd min for a T2 PD is 42.5V. The 'must turn on' range does not include
the operational range of the Type 2 PD.

SuggestedRemedy

Raise Von to 43V to include the lower operational limit of Type 2 PDs

Proposed Response   *Response Status*   **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

1) A type 2 PD has to work as a type 1 PD under some cases, therefore it has to meet the
(.af) startup requirements of T33-18 item11.

Practically speaking, startup transitions occur with a PD at very low current when the PSE
voltage is brought to its minimum. This elimiantes the loop IR drop, and assures a PD
startup.

See also comment 251 that requires specifies Von as a minimum voltage for start and
VportPD as static voltage afterwards.

Comment Type   **TR**   *Comment Status* **D**   *PD Hard*

p81, 33. Diodes with a lower voltage drop waste less power.
Existing requirement may prevent Schottky diodes from being used.
These diodes have a 500 uA leakage at high temperature and maximum reverse voltage.
If a current is backfeed into the PSE port very little will occur because many
systems have DC-blocking capacitors on the port termination.
Termination resistors without DC-blocking capacitors are typically
0603 in size and have a power dissipation limit of 1/10 W.
This corresponds to a current of 26 mA. Therefore, permitting
currents of up to 0.5 mA provides 52x margin on the resistor current ability.

SuggestedRemedy

Change the 100 k ohm test resistor value to 5.6 k ohm.
This keeps Vbfd the same and uses a standard resistor value. The maximum current
possible is 2.8V/5.6k = 0.5 mA

Subclause 5.2.2 of IEC 60950-1 specifies an insulation test voltage of a)1500 V rms or a DC voltage at least equal to the peak AC voltage e.g. b)2250 V dc. Impulse test of c)1500 V, 10/700 completely fails to reach the 2250 V peak stress voltage of tests a) and b). The TNV-1 CIRCUIT or a TNV-3 CIRCUIT voltage level of 1.5 kV is based on ITU-T K.21 Resistibility of telecommunication equipment installed in customer premises to overvoltages and overcurrents. In K.21 the assumed primary protector let-through voltage of 1.5 kV sets the 1.5 kV test level of K.21 test 2.1.1.b (basic). In the case of Ethernet circuits primary protectors are not installed, which will increase the inherent impulse voltage level. Conversely most Ethernet wiring is internal, which will decrease the impulse voltage level. For unprotected TNV-1 interfaces ITU-T K.21 specifies a higher level 6 kV (enhanced). A US telecommunication supplier has found it necessary to increase internal port withstand test level from 1.5 kV to 6 kV for their fibre to the home installations to reduce failures.

SuggestedRemedy

Change the option c) 1500 V 10/700 test level to 2250 V 10/700

Response   *Response Status* **W**

REJECT.

These are well established parameters set forth by the IEEE as minimum functional requirements and are not replacements for safety (or other) requirements that may need to be met by a specific product in a specific jurisdiction. IEC 60950-1 is only referenced for the methodologies.

See 178, which is the identical comment without a remedy.

This subclause states 'Each wire pair of the PSE or PD when it is encompassed within the MDI shall ..' however PSE and PD's don't have wire pairs, the PI does. Also the based on the Subclause 1.4.282 'Power Interface (PI)' definition 'In an Endpoint PSE and in a PD the Power Interface is the MDI.'. This subclause states that 'When a PSE is not encompassed within an MDI ..', similarly a PSE can't be encompassed into a MDI.
Suggest the condition be that a PI is also a MDI - or not - and that we be clear what we are really talking about is an Endpoint or a Midspan.

SuggestedRemedy

Suggest the text 'Each wire pair of the PSE or PD when it is encompassed within the MDI shall ..' is changed to read 'Each wire pair of the PI, when it is also an MDI (i.e., an Endpoint PSEs and PDs), shall ..' and that the text 'When a PSE is not encompassed within an MDI, the PSE PI shall ..' be changed to read 'When a PI is not an MDI (i.e., an Midspan PSE), , the PI shall ..' The resultant new paragraph would read:
'Each wire pair of the PI, when it is also an MDI (i.e., an Endpoint PSEs and PDs), shall meet the fault tolerance requirements of the appropriate specifying clause (see 14.3.1.2.7, 25.4, and 40.8.3.4.). When a PSE PI is not an MDI (i.e., an Midspan PSE), the PSE PI shall meet the fault tolerance requirements of this subclause.'

Response   *Response Status*   **C**

ACCEPT IN PRINCIPLE.

Change the text 'Each wire pair of the PSE or PD when it is encompassed within the MDI shall ..'
To: 'Each wire pair of the PI, when it is also an MDI (i.e., an Endpoint PSE or PD), shall ..'

The common mode ground reference is labeled as 'PG' however PG is the 'Protective Ground' of the AUI connector (see 7.5.2). This is therefore is only relevant to 10BASE-T MAU with an AUI connector. 10BASE-T covers the case of an embedded MAU by stating in subclause 14.3 'MAU electrical specifications' that 'The ground for all common-mode tests is circuit PG, Protective Ground of the AUI. In implementations without an AUI, chassis ground is used as circuit PG.'. The label PG does not appear in any of the other common-mode related figures.

SuggestedRemedy

At a minimum remove the label PG from this figure as it isn't included in the other common-mode related figures and doesn't appear anywhere else in the draft.
Text similar to that found in 1000BASE-T subclause 40.6 'PMA electrical specifications' that reads 'Common-mode tests use the common-mode return point as a reference.' can be added to subclause 33.4 if there is a desire to define the common-mode reference point.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Remove 'PG' from Figure 33-21.

Comment Type   **T**   *Comment Status* **A**

Since a PI is defined in Subclause 1.4.282 'Power Interface (PI)' defines a PI as 'The mechanical and electrical interface between the Power Sourcing Equipment (PSE) or Powered Device (PD) and the transmission medium. In an Endpoint PSE and in a PD the Power Interface is the MDI.' the marking of PI A and PI B in Figure 33-25 implies that the measurement is being performed between two separate PSEs or PDs on a NID rather than different PI wire pairs on the same PSE or PD. Since I think the latter is the intent here the labels A and B should be deleted and the two dotted lines should be joined.

SuggestedRemedy

Change 'PI A' to read 'PI' and delete 'PI B' from the figure, join the two dotted lines to form one single dotted line.

Response   *Response Status* **C**

Law, David   3Com

Comment Type **T**   *Comment Status* **A**
Since this isn't a conformance test specification, but an interoperability specification, it is
best if we can avoid specifying in terms of test conditions, but instead in terms of the
conditions under which the specification shall be met.
In addition subclause 33.4.4 items 1) and 2) already specify that the PD or PSE has to be
terminated as illustrated in Figure 33-24 so it is not necessary to state this again in this
paragraph.

SuggestedRemedy
Suggest that the entire subclause be changed to simply read 'The coupled noise, Ed_out in
Figure 33-24, from a PSE or PD to the differential transmit and receive pairs shall not
exceed 10 mV peak-to-peak when measured from 1 MHz to 100 MHz under the conditions
specified in 33.4.4, item 1) and item 2).'.
The PICS will need a similar update.

Darshan, Yair   Microsemi Corporation

Comment Type **TR**   *Comment Status* **A**
Draft D4.0 , 33.4.8, page 87 line 51
Comment:
There is already a requirement in the specification that guarantees the operation of 100BT
ALT A Midspans.
We can add it as alternative to 33.4.8 text.
Rational:
(1) 33.4.8 requires that:
Alternative A Type 2 Midspan PSEs that support 100BASE-TX
shall enforce channel unbalance currents less than or equal to
Type 1 Iunb (see Table 33-11)."
Which means:
Reducing Iunb to Type 1 levels increase PD Type 2 OCL to
350uH minimum i.e make the system as 350uH system.
(2) Now, prior to changing OCL from 350uH to 120uH in the Switch and PD, we define a
Transfer Function (Eq. 33-19 in 33.4.9.2) that 100BT ALT A Midspans has to meet in order
to work in 100BT ALT A Type 1 and Type 2 systems that uses OCL of 350uH hence this
equation was built for 350uH systems.
It was approved and supported by a motion by Yair Darshan and David Law.
See motion in: http://www.ieee802.org/3/at/public/2008/05/minutes_0508.pdf
See technical data attached to the motion in:
http://www.ieee802.org/3/at/public/2008/05/index.html
(3) Both requirements (1)+(2) above, 33.4.8 and 33.4.9.2 are equivalent alternatives i.e.
both of them supporting 350uH system.
As a result 33.4.8 can be updated as follows:
"Alternative A Type 2 Midspan PSEs that support 100BASE-TX shall enforce channel
unbalance currents less than or equal to Type 1 Iunb (see Table 33-11) or meet 33.4.9.2.
The rest is implementation that we don't care.
(Please see attached presentation "ALT A Midspan requirements - updating the spec" for
more details in the IEEE802.3at March 2009 site)

SuggestedRemedy
Change from:
"Alternative A Type 2 Midspan PSEs that support 100BASE-TX shall enforce channel
unbalance currents less than or equal to Type 1 Iunb (see Table 33-11).
To:
"Alternative A Type 2 Midspan PSEs that support 100BASE-TX shall enforce channel
unbalance currents less than or equal to Type 1 Iunb (see Table 33-11) or meet 33.4.9.2.

Table 33-23. The enumeration for PD Power source "10 = Local" is not valid since the
PD/PSE cannot exchange DLL packets when the PSE is not powering the PI or when PD is
not drawing power from the PI.

SuggestedRemedy

Delte this enumeration

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Delete this enumeration

The commenter points to an interesting subtelty in the protocol. Assuming that the L2
engine is enabled, if the PD goes to a local power, can the L2 engine stay up, perhaps to
allow for exchanges that are not related to budgeting or do we want to eliminate this
possibility. Recommend that this is discussed in the L2 ad-hoc

Cl **33**   *SC* **33.6.2.1**   *P* **98**   *L* **25**   # 225

Law, David   3Com

Comment Type **T**   *Comment Status* **A**

Should define what the reserved values are so that they can be used in the future if
required - reserved bits are usually defined as 'Write as zero, ignore on read' hence this
reserved bits should be 'Transmit as zero, ignore on receive'.

SuggestedRemedy

Change 'Reserved' to read 'Transmit as zero, ignore on receive' in the 'Value/meaning'
column for bits 3:2 of Table 33-23.

Response   *Response Status* **C**

ACCEPT.

p100, 30. To improve the PIC clarify the sentence.

SuggestedRemedy

Replace "A Type 1 PSE shall ..." with
"A Type 1 PSE that provides DLL classification shall ..."
Have the Editor update the related PIC.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

OBE 229

There should be a global PIC that has an optional capability for DLL classification. This
would eliminate the redundancy of doing this throughout the text. This could be introduced
at the top of the section.

Absent the above, implement the suggestion by the commenter

Cl **33**   *SC* **33.6.6**   *P* **106**   *L* **23**   # 112

Vetteth, Anoop   Cisco Systems, Inc.

Comment Type **TR**   *Comment Status* **A**

The PD updates it maximum permissible power draw in the PD POWER ALLOCATION
state. This happens when the new value is lesser than the present value or the PSE
allocated value. There is a cornercase bug if the PSE and PD settle at two different values,
with PSE allocated value being greater than the PD requested value. For example assume
that the steady state is PSE allocation is 20W and PD requested is 15W. The pD wants to
increase its request to 19W and simultaneously PSE wants to reduse its allocation to 15W.
When this happens, the PD should wait until its request is approved which it is not doing
currently.

SuggestedRemedy

The PD should be allowed to increase its max power draw only when the PSE and PD are
in sync with regard to the mirrored values. The proposed change is shown in attached pdf
avetteth_pdsm.pdf. Append to Section 33.6.7.2
"When the PD notices that the MirroredPDRequestedPowerValueEcho is equal to
PDRequestedPowerValueEcho, then the PD can assume that
MirroredPSEAllocatedPowerValue is the power that the PSE has presently allocated to the
PD. Based on this the PD updates its max permissible power draw by entering the
PD_POWER_REALLOCATION_2 state."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

The local_system_change variable is defined as 'An implementation specific control variable that indicates that the local system wants to change the locRequestedPowerValue.' yet the variable locRequestedPowerValue is not mentioned anywhere else in the draft.
The variable local_system_change is used both in the PSE and PD state diagrams a desire in the local system to change the power allocation, in a PSE to change the allocation to the PD, in a PD to indicate that it wishes to request a new allocation for the PSE.

SuggestedRemedy

An implementation specific control variable that indicates that the local system wants to change the allocated power value. In a PSE this indicates it is going to change the power allocated to the PD. In a PD this indicates it is going to request a new power allocation from the PSE.
Values: FALSE: The local system does not wants to change the power allocation.
TRUE: The local system wants to change the power allocation.

Response   *Response Status*   **C**
ACCEPT.

Law, David　　　　　　　　　3Com

Comment Type　**T**　　_Comment Status_　**A**

In the case of the examine_request function it is stated that PSE_New_Value is 'The new
max power value that the PSE expects the PD to draw.' This is only true in the cases where
change_accept is TRUE, when FALSE there request has been rejected and there will not
be a new max power value. Further it is stated that when change_accept is TRUE 'The
requested change to the allocated power is accepted', well if that is the case then
PSE_New_Value should be set to equal the value that the PD has requested, if it can be
set to another value the request hasn't really been accepted.

SuggestedRemedy

If the PSE can only accept of reject the requested new power, as the definition for the
variable change_accept seems to state, the variable PSE_New_value should read 'Set to
MirroredPDRequestedPowerValue when change_accept is set TRUE', if it can be set to
any value regardless of what the PD requested the variable PSE_New_value should read
'The new max power value that the PSE expects the PD to draw when change_accept is
set TRUE'.

There are two functions "examine_request" and "pse_power_review". One of them is called when there is local system change and the other is called when the PD is requesting for a change. We can combine the two into one function. Moreover since examine_request returns a new PSE power value, the transition from PD POWER REQUEST to PSE POWER REALLOCATION state should be UCT.

SuggestedRemedy

Use the same function pse_power_review for both states: PD POWER REQUEST and PSE POWER REVIEW. Delete "examine_request" function from 33.6.6.5. Remove the transition from PD POWER REQUEST to MIRROR UPDATE. Change the conditon for the transition from PD POWER REQUEST to PSE POWER REALLOCATION to UCT. Change the definition for pse_power_review to: "This function evaluates the power allocation or budget of the PSE based on local system changes or change in power request from the PD". Look at avetteth_psesm.pdf for comprehensive changes.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Editor to enact changes found in "avetteth_PSESM.pdf"

delete the function "examine_request" P103, L54

Comment Type **T**   *Comment Status* **A**   *121*

My comment that the two states 'PD POWER REALLOCATION' and 'PD POWER REQUEST' can be combined was incorrect and I withdraw it - unfortunately the myBallot system is write only so I cannot delete the comment now I have submitted it. The comment should have read as follows:
Since the transition between the states 'PD POWER REQUEST' and 'MIRROR UPDATE' is UCT the state 'PD POWER REQUEST' is redundant and the action in that state can be moved to 'MIRROR UPDATE' state.

SuggestedRemedy

Delete the 'PD POWER REQUEST' state and add the assignment 'PDRequestedPowerValue <= PD_New_Value' to the 'MIRROR UPDATE' state.

Response   *Response Status* **C**

ACCEPT.

Comment Type   **T**   *Comment Status*   **R**

The two states 'PD POWER REALLOCATION' and 'PD POWER REQUEST' perform the same action, that is assign 'PDRequestedPowerValue' the value 'PD_New_Value'. Since the transition between the two states is a UCT the state 'PD POWER REALLOCATION' is redundant

SuggestedRemedy

Delete the state 'PD POWER REALLOCATION', change the transition from 'PD POWER REVIEW' to 'PD POWER REQUEST' to read ((PD_New_Value > PDMaxPowerValue) * (PD_New_Value > TempVar)) + (PD_New_Value =< PDMaxPowerValue) + (PD_New_Value =< TempVar).

Response   *Response Status*   **C**

REJECT.

Commentor admits this comment was incorrect in comment 252

This text states that 'The PSE responds to a PD's request through the aDLLPSEAllocatedPowerValue (30.9.1.1.20) attribute in the PSE object class.'. Now it may depend on what is considered a response but the PSE copies the request to the 'echo' value, the aDLLPDRequestedPowerValueEcho (30.9.1.1.19) attribute when the PSE power control state diagram MIRROR UPDATE state. It will only change the aDLLPSEAllocatedPowerValue (30.9.1.1.20) attribute if the change requested by the PD is accepted - which can change at any other time if the PSE chooses to change the allocated value for internal reasons.

SuggestedRemedy

Suggest changing:
'The PSE responds to a PD's request through the aDLLPSEAllocatedPowerValue (30.9.1.1.20) attribute in the PSE object class. The PSE also copies the value of the aMirroredDLLPDRequestedPowerValue (30.9.1.1.18) attribute in the PSE object class to the aDLLPDRequestedPowerValueEcho (30.9.1.1.19) attribute in the PSE object class.'
to read
'The PSE responds to the PD's request by copying the value of the aMirroredDLLPDRequestedPowerValue (30.9.1.1.18) attribute in the PSE object class to the aDLLPDRequestedPowerValueEcho (30.9.1.1.19) attribute in the PSE object class. If the request is accepted the aDLLPSEAllocatedPowerValue (30.9.1.1.20) attribute in the PSE object class will be changed although it should be noted that this value can change at any time by the PSE to change the power allocated to the PD.'

Vetteth, Anoop   Cisco Systems, Inc.

Comment Type   **TR**   *Comment Status* **A**
item PSE19 - The spec does not require 1V difference between consecutive
measurements if there are more than 2 measurements

SuggestedRemedy
Remove consecutive

Response   *Response Status* **C**
ACCEPT IN PRINCIPLE.

From:
At least 1 V difference between consecutive measurements

To:
At least 1 V difference between any two measurements in the range of Vdetect

Cl **33**   *SC* **33.8.3.2**   *P* **114**   *L* **31**   # 117
Vetteth, Anoop   Cisco Systems, Inc.

Comment Type   **TR**   *Comment Status* **A**   *EZ*
Item PSE24, PSE25, PSE26 and PSE27 use just "classification" to describe physical layer
classification

SuggestedRemedy
Change classification to "physical layer classification"

Response   *Response Status* **C**
ACCEPT IN PRINCIPLE.

PSE24 is generic with respect to 1-Event Physical Layer classification, 2-Event Physical
Layer classificaion, and Data Link Layer Classification. No change needed.

PSE25, PSE26, and PSE27 should have "classification" changed to "Physical Layer
classification."

Cl **33**   *SC* **33.8.3.2**   *P* **114**   *L* **32**   # 265
Nadeau, Gerard

Comment Type   **G**   *Comment Status* **A**   *EZ*
Value/Comment Field: missing the '1' for 'Type 1 PSE'.

SuggestedRemedy
Add the '1'

Response   *Response Status* **C**
ACCEPT.

Comment Type **G** *Comment Status* **A** *EZ*

Subclause reference is incorrect and the state name is not quite correct. Update.

SuggestedRemedy

Change the fields in MF27 as follows. Sublcause: 33.5.1.2.6 Value/Comment: Replace ERROR_DELAY with ERROR_DELAY_SHORT

Response *Response Status* **C**

ACCEPT.

Cl **33** *SC* **Table 33-7** *P* **56** *L* **29** # 169

Beia, Christian STMicroelectronics

Comment Type **TR** *Comment Status* **D**

I don't see the reason for Table 33-7 to contain a link to table 33-11instead of straight numbers. It only adds difficulties for the reader.

SuggestedRemedy

Replace Ptype with: 15.4W for Type1 PSEs, 30W for Type2 PSEs. Use two lines for Type 1 and Type 2

Proposed Response *Response Status* **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

Ptype is not a number in Table 33-11 but instead an equation. While we agree that the level of misdirection in this standard is high, we have agreed to may times before to keep things defined in one place so as to be sure that there aren't conflicting definitions in the standard.
