Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

Draft 1.0 comment #48, even though accepted, was never implemented in the draft.

The comment was ...
"I'm not sure where to anchor this comment, but Annex 28D should also be amended to outline extensions of Clause 28 for Energy Efficient Ethernet and I propose that Clause 28 extensions for EEE include:
1. Auto-Negotiation is mandatory for a EEE PHY (this is currently not the case for 100BASE-TX)
2. The exchange of additional next pages for EEE capability and mode negotiation extends the time required to complete Auto-Negotiation. To reduce this time, a EEE PHY may use the extended next page mechanism introduced by IEEE 802.3an-2006 (it is not currently an option for 100BASE-TX)."

The suggested remedy was...
"Add amendment to Annex 28D per comment."

...and the adopted response was "ACCEPT".

SuggestedRemedy

Add amendment to Annex 28D per comment.

Grimwood, Mike Broadcom

Comment Type **T** *Comment Status* **X**

Figure 24-11b Receive state diagram, part b shows a transition to RX_LPI_LINK_FAIL upon expiration of lpi_rx_tw_timer_done. The intent of this comment is to provide a consistent mode of operation as was included in Clause 40 in which this transition is replaced with a new timer, lpi_link_fail_timer such that the transition to link failure is deferred and instead failures to wake within lpi_rx_tw_timer_done increment a wake error counter.

SuggestedRemedy

Introduce changes to count 100BASE-TX LPI wake failures and to defer the transition to RX_LPI_LINK_FAIL including the following:

Change Figure 24-11b introducing the timer lpi_link_fail_timer for the transition from RX_WAKE to RX_LPI_LINK_FAIL.

Introduce lpi_link_fail_timer with a value of 90 us to 110 us.

Introduce a 100BASE-TX wake error counter such that this counter is incremented each time lpi_rx_tw_timer_done transitions from FALSE to TRUE.

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

The messages PMD_RXQUIET.request and PMD_TXQUIET.request imply that they are PMD service interface primitives. It seems that, to be consistent with the layer model, this information should be delivered to the sublayer below the PCS which may be either the Clause 51 PMA sublayer or the optional Clause 74 10GBASE-R FEC sublayer.

In addition this information is more closely associated with the text in 49.1.5 and Figure 49-4 should be relocated accordingly.

Finally, the precedent set by Clause 49 is that the detailed service interface primitives are defined in the Clauses 51 and 74. Hence, the new service interface primitives used by Clause 49 Energy Efficient Ethernet should be defined in both Clauses 51 and 74 respectively.

SuggestedRemedy

Comment Type **T** *Comment Status* **X**

To support wake time fault, there needs to be another state - after RX_WAKE, the PHY must detect a situation where the PHY does not reach a state where data service can be established with an acceptable BER.

SuggestedRemedy

Add a term "* training_done" for the two transitions out of RX_WAKE (not the one with rx_tw_timer_done).

Add a new state ASSERT_WTF

Make a transition from RX_WAKE to ASSERT_WTF:
rx_tw_timer_done * rx_block_lock = OK

Make a transition from ASSERT_WTF to RX_ACTIVE
R_TYPE(rx_raw) != LI

Make a transition from ASSERT_WTF to RX_SLEEP
R_TYPE(rx_raw) = LI

In state ASSERT_WTF, add action "assert_WTF"

In 49.2.13.2.3 Functions, add

assert_WTF
An unexpected event has caused the PHY to complete the wake process without reaching a state where dats aervice can be established with an acceptable BER (add link to clause 45 counter)

In 49.2.13.2.6 Messages, add

PCS_TRAINING_DONE.indication(training_done)
A signal sent by the PMD that, when TRUE, indicate that the receiver is operating normally and should support a data service with an acceptable BER. When FALSE indicates that some form of training is in process following an interruption to normal link operation such as low power idle. PHY devices that do not support optional functions requiring this signal shall set the value as TRUE.

The variable signal_detect is not defined. It should be signal_ok.

SuggestedRemedy

Consistent with its usage in other Clause 49 state diagrams, replace "signal_detect = TRUE" with "signal_ok" and "signal_detect = FALSE" with "!signal_ok".

Proposed Response *Response Status* **O**

Cl **49** *SC* **49.2.13.3.1** *P* **154** *L* **20** # 89

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

Is is really necessary to "de-bounce" signal_detect = FAIL (which should be !signal_ok)?

The value of signal_ok is a) communicated from the PMA sublayer to indicate that the PMD detects the presence of a signal AND that the PMA is able to synchronize to that signal or b) from the optional FEC sublayer to indicate, in addition to the PMA criteria, that FEC block lock has been acheived.

Neither of these criteria seems likely to be tricked by the power-down transient of the link partner transmitter.

SuggestedRemedy

Remove RX_DEACT state and delete the definition of rx_deact_timer.

Proposed Response *Response Status* **O**

Cl **49** *SC* **49.2.13.3.1** *P* **154** *L* **33** # 90

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

In the LPI Receive state diagram (Figure 49-17), the use of rx_block_lock as a criteria for exit from the RX_WAKE state implies that the process described by the state diagram in Figure 49-12 is used to re-establish lock. It has been established that this process consumes an undesirable portion of the total wake time and that means to accelerate the lock process is desired.

It is currently not indicated in the draft what the lock criteria is for this acclerated process or relationship of this new process to the "conventional" lock process.

SuggestedRemedy

Define rx_block_lock in terms of the accelerated lock criteria and employ that same criteria to initialize the "conventional" Lock state diagram (Figure 49-12) such that (rx_)block_lock = TRUE.

Proposed Response *Response Status* **O**

Cl **49** *SC* **49.2.13.3.1** *P* **154** *L* **40** # 63

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

The RX_LINK_FAIL state, the time lpi_link_fail_timer, and rx_lpi_fail variable serve no useful purpose in the in the LPI Receive state diagram (Figure 49-17).

1. When Auto-Negotiation is enabled, setting block_lock = FALSE in the RX_LINK_FAIL state will cause hi_ber = TRUE and, in turn, cause Auto-Negotiation to re-start. There is no point in dwelling in the RX_LINK_FAIL state for any period of time. Even when Auto-Negotiation is disabled, there is no obvious reason to dwell in this state after setting block_lock = FALSE.

2. The value of rx_lpi_fail is set to TRUE in the RX_LINK_FAIL state and FALSE upon entry into the RX_ACTIVE state, but it is used nowhere else and has no obvious purpose.

3. It is not desirable the break the link in the event of a failure to acheive rx_block_lock within rx_tw_timer. Expiration of rx_tw_timer should correspond to the increment of a "wake error counter" in the same manner as currently defined for 1000BASE-T. Expiration of an lpi_link_fail_timer should be used to break the link if the PHY fails to acheive lock after a prolonged period.

SuggestedRemedy

1. Delete the definition of the lpi_fail_timer and its associated uses in the LPI Receive state diagram.

2. Delete the definition of the variable rx_lpi_fail and the associated assignments in the LPI Receive state diagram.

3. Delete the RX_LINK_FAIL state.

4. Replace the transition from RX_QUIET to RX_LINK_FAIL with a transition from RX_QUIET to RX_ACTIVE with the transition condition (!signal_ok * rx_tq_timer_done). This will cause block_lock to be assigned the value of rx_block_lock, which presuambly false since !signal_ok is TRUE, and hence has the same effect as entering the old RX_LINK_FAIL state.

5. Remove rx_tw_timer_done from the transition conditions from RX_WAKE to RX_ACTIVE and RX_SLEEP. Stop rx_tw_timer upon entry in RX_ACTIVE and RX_WAKE.

6. Define lpi_link_fail_timer to have a duration of 250 microseconds +/- 10%. Start lpi_fail_timer in the RX_WAKE state. Add the condition "+ lpi_fail_timer_done" to the transition from RX_WAKE to RX_ACTIVE.

Editor's note says:
"This synchronization method works well for loop-timed links. Non-loop-timed links require further attention."
Either verify that the synchronization method works for non-loop-timed links or make loop-timing mandatory and eliminate references to the non-loop-timed option

SuggestedRemedy

The non-loop-timed mode is a legacy of past compromises in the development of the standard and not a useful option hence the simple solution is to eliminate it.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.3.5.1** *P* **169** *L* **45** # 61

Grimwood, Mike Broadcom

Comment Type **T** *Comment Status* **X**

Currently LPI slave synchronization is accomplished at the transition to PCS_Test. By instead performing slave synchronization at the transition to PMA_Training, partial frame ambiguity can be eliminated and can simplify the specification and resulting implementations. Performing synchronization at the transition to PMA_Training ensures that the slave's final PHY frame and final InfoField will be complete.

SuggestedRemedy

Modify the text in section 55.3.5.1 to perform LPI slave synchronization at the transition to PMA_Training_Init_S instead of at the transition to PCS_Test.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.3.5.2.4** *P* **173** *L* **42** # 58

Grimwood, Mike Broadcom

Comment Type **T** *Comment Status* **X**

Changes to section 55.3.5.2.4 (Functions) are needed in order to properly define the following:

R_BLOCK_TYPE = LI
R_BLOCK_TYPE = I
T_BLOCK_TYPE = LI
T_BLOCK_TYPE = I

These types are used in the PCS state diagrams of 55.3.5.4 but are not explicitly defined.

SuggestedRemedy

Add the following descriptions for both R_BLOCK_TYPE and T_BLOCK_TYPE (IEEE802.3an-2006 55.3.5.2.4 pages 96, 97):

Values:

I; If the optional Low Power Idle function is supported then I type is a special case of the C type where the vector contains a data/ctrl header of 1, a block type field of 0x1e, and eight control characters of 0x07 (/I/).

LI; If the optional Low Power Idle function is supported then LI type is a special case of the C type where the vector contains a data/ctrl header of 1, a block type field of ox1e, and eight control characters of 0x06 (/LI/).

Parnaby, Gavin Solarflare Communica

Comment Type **TR** *Comment Status* **X**

To meet wake shrinkage requirements, I think we need to change rx_raw<=LI in RX_W to rx_raw<=I.

This guarantees that the 9 frames of wake are forwarded by the PHY.

It does create an issue if i) the alert is asserted incorrectly or ii) the PHY wakes up with errors.

SuggestedRemedy

change rx_raw<=LI in RX_W to rx_raw<=I.

Make the transition from RX_W to RX_C (lpi_rx_wake_timer_done = true * (R_TYPE(rx_coded)=I + R_TYPE(rx_coded)=LF))

Make the transition from RX_W to RX_E (lpi_rx_wake_timer_done = true * !(R_TYPE(rx_coded)=I + R_TYPE(rx_coded)=LF))

This remedy may be changed by the shrinkage ad hoc.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.3.5.4** *P* **178** *L* # 106

Parnaby, Gavin Solarflare Communica

Comment Type **TR** *Comment Status* **X**

For the state timing shown on page 178 to work correctly we need a requirement that the alert is signalled by the PMA after the full alert signal has been detected (so that the lpi_rx_wake_timer encompasses the true wake signal).

Any other alert detection timing does not give the PHY wake_time frames to recover the signal.

SuggestedRemedy

Add text to say 'The PMA asserts alert_detect after the entire alert signal (3.5 LDPC frames of alert, and 0.5 frames of silence) has been detected.'

Proposed Response *Response Status* **O**

Comment Type **T** *Comment Status* **X**

SEND_QUIET and SEND_REFRESH can be merged. At the moment the states are a parallel mechanism to the tx_refresh_active & active_pair controls defined in Tables 55-4 and 55-5. This is confusing and it allows the possibility that the timers could get out of sync with the logic defined in 55.3.5.1.

SuggestedRemedy

Combine the SEND_QUIET and SEND_REFRESH states into a SEND_QR state. In this state tx_refresh_active and tx_active_pair are configured as shown in Tables 55-4 and 55-5.

If we want to preserve avoiding sending partial refreshes at the start of LPI then I think we need to add another state.

Update text to be consistent with the currently defined operation of the PHY.

SuggestedRemedy

Replace paragraph with the following:

A 10GBASE-KR PHY may optionally enter a low power state to conserve energy during periods of low link utilization. This capability is more commonly known as Energy Efficient Ethernet. The presence of "Assert low power idle" at the XGMII is encoded in the transmitted symbols. Detection of low power idle encoding in the received symbols is indicated as "Assert low power idle" at the XGMII. Upon the detection of "Assert low power idle" at the XGMII, an Energy Efficient 10GBASE-KR PHY sends sleep symbols for a defined period, then ceases transmission and deactivates transmit functions to conserve energy. The PHY periodically transmits during this quiet period to allow the remote PHY to refresh its receiver state (e.g. timing recovery, adaptive filter coefficients) and thereby track any long term variation in the timing of the link or the underlying channel characteristics. If normal inter-frame is asserted at the XGMII while the PHY is in low power mode, the PHY re-activates transmit functions and initiates transmission. This transmission will be detected by the remote PHY receiver, causing it to also exit the low power mode.

Delete 72.6.11.3 and 72.6.11.4

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.3.1** *P* **222** *L* **52** # 74
Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

Per the current LPI transmit state diagram (Figure 72-6), synchronization of 10GBASE-R FEC via the assignment of a variable is not likely to be a complete solution or consistent with the layering model. Modifications to Clause 74 are required, as well as inter-sublayer communications required by such modifications. Recall that there is no direct communication path from the PMD to the FEC (the PMA is in between).

SuggestedRemedy

Delete that tx_fec variable and the "Start tx_fec" option from LPI transmit state diagram. Instead, add appropriate amendments to the Clause 74 and update the inter-sublayer interfaces accordingly.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.3.1** *P* **223** *L* **1** # 200

Pillai, Velu Broadcom

Comment Type **TR** *Comment Status* **X**

tx_quiet has only two values: TURE or FLASE. But the state machine assigns TRUE, FLASE, REFRESH and WAKE.

SuggestedRemedy

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.3.1** *P* **223** *L* **7** # 73

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

The definition of tx_quiet is inconsistent with its use in the LPI Transmit state diagram (Figure 72-6). For consistency, it should be an enumerated variable with the values of FALSE, REFRESH, TRUE, and WAKE.

SuggestedRemedy

Update variable definition accordingly.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.3.3** *P* *L* # 190

Koenen, David Hewlett Packard

Comment Type **TR** *Comment Status* **X**

Training frames may no longer apply as can use /LI/ symbols to train during fresh and wake.

SuggestedRemedy

Modify state diagram to take direction from signal_detect, PCS/PMA and rx_quiet to enter/exit quiet states.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.4.2** *P* **225** *L* **4** # 71

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

Per the current LPI Receive state diagram (Figure 72-7), a 10GBASE-KR PHY can never wake from low power mode.

1. Entry into RX_SLEEP causes signal_detect to be set to FALSE
2. signal_detect = FALSE corresponds to !signal_ok at the PCS (incorrectly shown as signal_detect = FALSE in the current draft) which results in rx_quiet being set to TRUE.
3. The transition to RX_WAKE requires rx_quiet to be set to FALSE, which cannot occur so long as signal_detect = FALSE.

Hence the state diagram deadlocks in RX_SLEEP. However, it is also odd that signal_detect is never reset to TRUE. This issue that, in low power mode, signal_detect should represent a function comparable to sense_signal as defined in 72.6.4b.

SuggestedRemedy

Modify state diagram, defining or re-defining variables as appropriate, to ensure signal_detect is set according the sense_signal critera of 72.6.4b.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.4.2** *P* **225** *L* **6** # 72

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

In the LPI Receive state diagram (Figure 72-7), saved coefficient are never restored (e.g. rx_coeff are never set to rx_saved). However, this level of detail could be considered implementation specific and should be beyond the scope of the standard.

SuggestedRemedy

Remove rx_saved assignment from the state diagram and delete the definition of the rx_saved and rx_coeff variables.

Proposed Response *Response Status* **O**

Comment Type **T** *Comment Status* **X**

BP training

The signal detect function needs to act like a classic signal detect to support operation in the PMA & PCS during LPI.

SuggestedRemedy

Replace current text in 72.6.4a & 72.6.4b with the following:

72.6.4a PMD signal detect function during low power operation

If Energy Efficient Ethernet is supported, the PMD needs to revert to a classic operation for SIGNAL_DETECT. This indicates when the electrical signal level at the input of the receiver is within certain threshold voltages. The PMD shall provide SIGNAL_DETECT function which sets SIGNAL_DETECT to a value of TRUE within TSA after a step increase in the differential peak-to-peak voltage exceeding the Signal Detect Assertion threshold of VSA as specified in
Table 72-6.

The SIGNAL_DETECT parameter shall be set to FAIL within a maximum of TSD after a step decrease in the differential peak-to-peak input voltage from a value greater than the Signal Detect Assertion Threshold to a differential
signal level less than the Signal Detect Deassertion Threshold of VSD as specified in Table 72-9

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.4a** *P* **218** *L* **39** # 75

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **X**

The text in this subclause is stale as the references to features in the LPI Receive state diagram (Figure 72-7) no longer exist. The desired behavior of signal_detect in low power mode is correctly summarized in terms of the sense_signal function defined in 72.6.4b.

SuggestedRemedy

Re-arrange to correctly describe the desired behavior.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.4a** *P* **218** *L* **41** # 176
Koenen, David Hewlett Packard

Comment Type **TR** *Comment Status* **X**

Signal_detect will not be generated by a LPI state machine but by receiver voltage levels. Also Sense Signal is not needed anymore as Signal Detect will suffice.

SuggestedRemedy

Delete the paragraph under 72.6.4a. Move the paragraph under 72.6.4b to 72.6.4a and change to sense signal to signal_detect where appropriate.

Diab, Wael Broadcom

Comment Type **TR** *Comment Status* **X**

D1.2.1 changed the requirement for layer 2 from mandatory to optional. For 100M and some low end systems, the rationale is that LLDP engines may not always be present, hence the broadmarket is best served with an optional feature. While more and more 100M and triple speed systems are implementing LLDP for a variety of reasons including AVB, PoEP, Link Agg etc. it seems reasonable to keep LLDP optional. 10G systems, however, are very sophisticated systems that implement a stack of protocols including LLDP. There seems to be little reason to make the LLDP optional on such systems.

SuggestedRemedy

Please change

"The Data Link Layer capabilities are optional for all devices."

to

"The Data Link Layer capabilities shall be implmented for devices that are 10 Gbps or high. The Data Link Layer capabilities are optional for all devices and may be implemented."

Zimmerman, George Solarflare Communica

Comment Type **TR** *Comment Status* **X**

On reflection, it seems that our protocol lacks a fail-safe. If a receiver, for some reason, senses a faster environmental change in the link than can be adapted for using the refreshes (or rather, senses it's SNR is degrading), it has no way to reach out for help and re-establish the steady stream of idles. This gives it no choice but to proceed down a path to bringing the link down - something that is probably preventable.

SuggestedRemedy

Task force to discuss - add a new code (to be substituted for idle in the stream) and state transitions to allow receiver (for each PHY type that might have this issue) to force a WAKE transition.

Proposed Response *Response Status* **O**

Cl **78** *SC* **78.1.3** *P* **235** *L* **25** # 102

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **X**

It would be valuable if a LPI-capable PHY were able to request that the system transition from the low power mode (e.g. if the SNR is dropping).

I believe that a mechanism for this already exists but it is not stated explicitly in the draft. I think we should add text pointing out this mechanism.

Using 10GBASE-T as an example: If a PHY detects dropping SNR and therefore wants to exit LPI, then it should assert local fault. The MAC will detect this and transmit LF to the link partner. Then the MAC at the link partner will detect the remote fault and start transmitting idles, bring the LPI period to an end.

This works whether the LPI state is symmetric or asymmetric (in the symmetric case the local MAC needs to send alert/wake to the link partner before it can transmit LF).

If the SNR degradation occurs relatively slowly this could preserve the link without a restart.

It may be desirable to add counters or some other mechanism to monitor this exit condition.

SuggestedRemedy

Add some informative text stating the above within Clause 78.

e.g.

A mechanism exists that allows PHYs to force a link to exit the lower power mode. If a PHY detects that the SNR on a link is rapidly degrading, it informs the local MAC that a local fault exists. This triggers the MAC to send local fault characters to the link partner. The reception of these characters by the remote MAC causes the remote MAC to transmit IDLEs, which brings the lower power mode to an end and gives the local PHY the opportunity to retrain in the normal operational mode.

Dietz, Bryan Alcatel-Lucent

Comment Type **ER** *Comment Status* **X**

Replace the entire first paragraph with the following to clarify the intended functioning of the following state diagrams per ad-hoc meeting 2/23.

The transmitting link partner controls when data is sent. After leaving Low Power Idle mode, the transmitting link partner waits before sending a frame. This provides enough time for the receiving link partner to transition out of LPI mode and get ready to receive the frame without loss or corruption.

" The transmitting link partner must wait for TX Tw_sys microseconds after leaving LPI mode before sending a frame.
" The receiving link partner must be ready to receive a frame RX Tw_sys microseconds after leaving LPI mode.
" The transmit Tw_sys must be equal to or greater than the receive Tw_sys for proper operation. The purpose of the EEE TLV and state machines is to resolve the correct Tw_sys values.

The state diagrams in sections 78.4.4.5 provide the following features on each direction of the bidirectional link.

" The initial Tw_sys defaults to the Tw_sys values required by the PHYs. This provides loss- and corruption-free EEE operation without exchanging TLVs.
" The state machines initialize the MIB transmit and receive Tw_sys values to larger values if supported by the overall system. These values can provide longer delays that allow deeper sleep modes for the system outside of the PHYs.
" The state machines monitor and control the EEE MIB variables exchanged by LLDP. The state machines find the longest "resolved Tw_sys" supported at that time by both the transmitter and receiver. This can provide the largest total system power savings.
" The state machines will update the resolved Tw_sys value when the transmit Tw_sys is increased or decreased.
" The state machines will update the resolved Tw_sys value when the received Tw_sys is increased or decreased.
" The Transmit Tw_sys is considered "resolved" when a local partner's state machine resides in the "RUNNING STATE" as described in section 78.4.4 and the echoed values match the local device's values for that path.

SuggestedRemedy

The transmitting link partner controls when data is sent. After leaving Low Power Idle mode, the transmitting link partner waits before sending a frame. This provides enough time for the receiving link partner to transition out of LPI mode and get ready to receive the frame without loss or corruption.

" The transmitting link partner must wait for TX Tw_sys microseconds after leaving LPI mode before sending a frame.
" The receiving link partner must be ready to receive a frame RX Tw_sys microseconds after leaving LPI mode.
" The transmit Tw_sys must be equal to or greater than the receive Tw_sys for proper operation. The purpose of the EEE TLV and state machines is to resolve the correct Tw_sys values.

The state diagrams in sections 78.4.4.5 provide the following features on each direction of the bidirectional link.

" The initial Tw_sys defaults to the Tw_sys values required by the PHYs. This provides loss- and corruption-free EEE operation without exchanging TLVs.
" The state machines initialize the MIB transmit and receive Tw_sys values to larger values if supported by the overall system. These values can provide longer delays that allow deeper sleep modes for the system outside of the PHYs.
" The state machines monitor and control the EEE MIB variables exchanged by LLDP. The state machines find the longest "resolved Tw_sys" supported at that time by both the transmitter and receiver. This can provide the largest total system power savings.

" The Transmit Tw_sys is considered "resolved" when a local partner's state machine resides in the "RUNNING STATE" as described in section 78.4.4 and the echoed values match the local device's values for that path.

System Tw can be resolved using one simple and static equation. This would simplify the standard, the implementation and testing.

Careful examination of the proposed equation and rule shown below will show that this covers every corner case.

SuggestedRemedy

The attached presentation describes the details of the proposal.

In summary, the four parameters defined in the TLV can be combined in the following equation:

Resolved system Tw = min(remote Rx Tw, max(local Tx Tw, remote echo Tx Tw))

The only additional rule required is that the system shall not change a parameter unless the current local value matches the remote echoed value.

The word "state" is misspelled in the table header.

SuggestedRemedy

Change to "state".

Symbol in box on the left titled "remote change" seems to have been garbled. It is showing up as a question mark.
TempRxVar ? RemRxSystemValue

Replace ? with an assignment statement

SuggestedRemedy

As per comment
