Cl **00**   *SC* **0**   *P*   *L*   # 279

Diab, Wael   Broadcom

Comment Type **ER**   *Comment Status* **D**   *802.1AS*

The current terminology for referencing 802.1AS is not correct. Its a hybrid between a draft and a final standard. For a project in process we usually use the designation P802.1AS. Once it is approved it will become IEEE Std 802.1AS-2010 is it were to get approved this year, 2011 if it were to get done next year.

SuggestedRemedy

I would suggest:
- Using the draft terminology for now as we dont know when it will publish so change the references to IEEE P802.1AS
- Add an editor's note towards the beginning of the draft that you will check prior to publication
- Check prior to ratification or when AS publishes to change to the final nomenclature

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
Change all reference to "IEEE Std P802.1AS-201X" to "IEEE P802.1AS"
Add an Editorial note prior to 90.1 with the following text "EDITORAL NOTE (to be removed prior to publication): Once IEEE P802.1AS draft is published, update references accordingly"

Magee, Anthony   ADVA Optical Network

Comment Type **T**   *Comment Status* **D**

It is my understanding that Time Synchronization Protocols such as the profile of IEEE 1588-2008 proposed by P802.AS are likely to be used only with Full-Duplex Phy modes.

SuggestedRemedy

We should mention somewhere in the draft, that half-duplex operation of the Phy is likely to cause variable delays for both transmit and receive. If the task force agrees, perhaps we could recommend use of Full Duplex operation for support of Time Synchronization.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
See comment #296.

Cl **00**   *SC* **0**   *P*   *L*   # 291

Chalupsky, David   Intel Corp.

Comment Type **E**   *Comment Status* **D**   *page numbering, editorial*

Page numbering starts over with each clause. Also uses Roman numberals for introduction clause.   It has been common practice in other task forces to use sequqntial numbering to avoid ambiguity between the .pdf page number and the number printed on the page.

SuggestedRemedy

Number all pages in the draft sequentially, starting with 1. Do not retsart at clause boundaries.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.

Diab, Wael   Broadcom

Comment Type **TR**   *Comment Status* **D**   *90.3*

Terms such as "outside of scope of IEEE Std 802.3" are often used in reference to the TimeSync Client. This seems pretty wordy to constantly use, redundant and raises the question of who's scope it is.

SuggestedRemedy

Either directly in 90.3 or a subsection of 90.3 address the scope of TimeSync Client and where it is defined directly. Eliminate the out of scope references all together after you do this in 90.3.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
In 90.3, replace the existing paragraph with the following statement "Per 90.2, the TimeSync capability provides support for various time synchronization protocols, including among the others, IEEE Std 1588v2-2008 or IEEE P802.1AS. The definition of TimeSync Client, its capabilities and functions is outside the scope of IEEE Std 802.3."
Remove similar statements on page / line
21 / 10
21 / 38
21 / 42
(Note: there were not so many reference sot this text after all)

Comment Type   **E**   *Comment Status* **D**   *editorial*

Why are we using colored text in the clean draft, specifically green. I understand the
coloring when a diff is done but not on the base. For crefs we usually use special text to
identify it so it is linked at then end; atleast that is what I *think* the green is for

SuggestedRemedy

Pls. remove the coloring on the clean document, specifically the green on the cross refs.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.

Cl **00**   *SC* **0**   *P*   *L*   # 249
D'Ambrosia, John   Force10 Networks

Comment Type   **TR**   *Comment Status* **D**   *90.1*

90.1 states "Nothing in the existing specification
prevents support of the optional TimeSync capability in PHYs operating at 10 Mb/s, 100
Mb/s, 1000 Mb/s, 10 Gb/s or even 40/100 Gb/s. Support for future PHYs depends on the
availability of the gRS sublayer as defined in 90.5."

However, 90.5 states
In the scope of this clause, the term generic Reconciliation Sublayer (gRS) is used to
denote any type of IEEE Std 802.3 Reconciliation Sublayer used to interface MAC with any
type of PHYs supporting the optional TimeSync capability through the xMII. Specifically,
the following types of RS sublayer are part of
gRS: RS for 100 Mb/s operation as defined in Clause 22, RS for 1000 Mb/s operation as
defined in Clause 35 and RS for 10 Gb/s operation as defined in Clause 46.

It is unclear if this standard is supposed to support 40GbE and 100GbE.

SuggestedRemedy

If 802.3bf is suppose to support 40GbE and 100GbE then the RS sublayer specified in
Clause 81 should be included in 90.5. If 802.3bf does not support 40GbE / 100GbE, then
the statement regarding support for it should be removed from 90.1.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Anslow, Pete   Ciena

Comment Type   **T**   *Comment Status* **D**   *cision, latency measurement*

The draft does not define exactly what instants the latency is measured between.

45.2.1.101 TimeSync PHY transmit latency and 45.2.1.102 TimeSync PHY receive latency
state that the "latency is expressed in units of ns" but does not define the starting and
stopping events precisely.

In the transmit direction, the latency definition start is presumably the detection of a valid
SFD in the xMII transmit signals. Is this on the negative edge of the clock?

A more serious issue is - what is the latency definition end? What part of the outgoing
signal passing the MDI?

For a latency expressed in units of ns, these must be defined much more precisely than
currently.

SuggestedRemedy

Define the latency bounding events precisely.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
The precision requirement was discussed with 802.1AS TF already multiple times, without
strict guidelines on what level of precision is required from 802.3bf. Suggest to discuss this
topic witihn 802.3bf TF again at the meeting - see comment #227.
For latency measurement, see comment #256.

Frazier, Howard   Broadcom Corporation

Comment Type **TR**   *Comment Status* **D**   *PICS*

The word "shall" does not appear anywhere in the body of this draft (there is one instance in the "Patents" section of the frontmatter). A standard is supposed to state mandatory requirements, and identify these requirements with the word "shall". A document that does not contain any mandatory requirements should be classified as a recommended practice, or a guide, yet the PAR for this project says that a standard will be produced.

SuggestedRemedy

Either:
A) Identify mandatory requirements with the word "shall" (specific suggestions will be made in subsequent comments), or
B) Change the document to be a standalone recommended practice, rather than an amendment to IEEE Std 802.3.

Proposed Response   *Response Status* **W**

Booth, Brad   AppliedMicro

Comment Type **TR**   *Comment Status* **D**   *C45, C30 registers*

Just came to the realization that while we are making the protocol to support 10M, 100M, 1G, 10G, 40G and 100G, etc., the register access is compatible with existing Clause 22 devices or their translators per Annex 45A. Need to make this register set available in the Clause 22 extension registers. Also, reference is to PCS, but it is the PMA/PMD registers that are referenced.

SuggestedRemedy

Change:
If a Clause 45 MDIO Interface to the PCS is present, then this attribute maps to register 1.1800.x (TimeSync PHY capability register, see 45.2.1.xxx).
To read:
If a Clause 45 MDIO Interface is present and the speed of PHY operation is 10 Gb/s or greater, then this attribute maps to register 3.1800.x (TimeSync PHY capability register, see 45.2.3.xxx). If a Clause 45 MDIO Interface is present and the speed of PHY operation is 1 Gb/s or less, then this attribute maps to register 29.1800.x (TimeSync PHY capability register, see 45.2.8.xxx).

This needs to be applied to all the attributes.

Move Clause 45 edits from the PMA/PMD to the PCS register set.

Duplicate the registers in the 45.2.8 for Clause 22 extension registers.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
[1] Move registers in C45 from block 1.xxx (PMA/PMD registers) to block 3.xxx (PCS registers), updating the accordingly. The new register numbers will be 3.1800 ...
[2] update links in C30 & C90 accordingly
[3] rest of actions per Suggested Remedy

Frazier, Howard   Broadcom Corporation

Comment Type   **TR**   *Comment Status* **D**   *registers 30.12.1.3*

The Clause 30 attributes for TimeSyncLatency are directly mapped to the values of the
PHY transmit latency registers in Clause 45, and explicitly include only the PHY latencies.
What if the gRS sublayer TS_SFD_Detect functions involve additional latency? There is no
way that a PHY can know how much, if any additional latency is imposed by the gRS
sublayer TS_SFD_Detect functions, but it is reasonable to assume that the pervasive
management entity has access to this information, and it makes sense to include this
additional latency (if any) in the Clause 30 attributes.
In the transmit path, any latency associated with the TS_SFD_Detect_TX function must be
subtracted from the PHY delay, while in the receive path, any latency associated with the
TS_SFD_Detect_RX function must be added to the PHY delay.

SuggestedRemedy

Add the following sentence to the behavioural definition of aTimeSyncLatencyTXmax:
The value reported in this attribute shall be adjusted to account for any latency associated
with the TS_SFD_Detect_TX function by subtracting this latency from the value reported by
the PHY.

Also make the corresponding change in 30.12.1.4.

In 30.12.1.5, add the following sentence to the behavioural definition of
aTimeSyncLatencyRXmax:
The value reported in this attribute shall be adjusted to account for any latency associated
with the TS_SFD_Detect_RX function by adding this latency to the value reported by the
PHY.

Also make the corresponding change in 30.12.1.6.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.
See comment #208 for base changes to C45 and C30 registers.
In terms of edits:

Add the following text to the behavior definition of the aTimeSyncLatencyTXmax, after the
first sentence:
The value reported in this attribute shall be adjusted to account for any latency associated
with the TS_SFD_Detect_TX function by subtracting this latency from the value reported by
the PHY.

Also make the corresponding change in 30.12.1.4.

Add the following text to the behavior definition of the aTimeSyncLatencyRXmax, after the
first sentence:
The value reported in this attribute shall be adjusted to account for any latency associated
with the TS_SFD_Detect_RX function by adding this latency to the value reported by the
PHY.

Also make the corresponding change in 30.12.1.6.

Zimmerman, George   Solarflare Communica

Comment Type   **TR**   *Comment Status* **D**   *Register size*
Using 32 bits for the phy latency in nanoseconds seems excessive. No 802.3 PHYs have
latency beyond microseconds. Additional latency would be above the PHY layer, in the
MAC. 16 bits would allow 65 usec latency.

SuggestedRemedy
Consider reducing latency fields to 16 bits, or justify 32 bits.

Proposed Response   *Response Status* **W**
PROPOSED ACCEPT IN PRINCIPLE.
While it is technically reasonable, this specific register size was included at the request of
IEEE 802.1AS TF, during consultations between IEEE P802.3bf and P802.1AS.

Frazier, Howard   Broadcom Corporation

Comment Type **TR**   *Comment Status* **D**   *C45, C30 registers*

The phrase "when the link is established" does not correspond to the wording used to
describe the receive link status bit in 45.2.1.2.2. The receive link
status bit indicates when the link is up or down, not when it "is established".
Furthermore, the phrase "when the link is established" implies a point in time, rather than
an ongoing condition. We want the PHY latency measurement values to be valid whenever
the link is operational, not merely at the point in time when the link was established.

SuggestedRemedy

Change the last sentence of 45.2.1.101 to read:
The values contained in these registers shall be valid while the PMA/PMD receive link is
up, as indicated by bit 2 in register 1.1 (see 45.2.1.2.2).
PHY latency measurement requirements are defined in 90.8.

Also make the corresponding change in 45.2.1.102.

Brown, Matt   AppliedMicro

Comment Type **TR**   *Comment Status* **D**   *Open, latency measurement*

It is not clear between which points the latency value is relevant to. First, the end points are
not explicitly defined. Second, the register is in device 1 and so may be assumed to be
MDI to PCS. Third, in the case of a PHY that is in a different device than the MAC (a) the
latency of the PHY device would be from MDI to PHY XGXS and (b) the latency of the
XGXS is not accounted for and could not be reported in device 1 as this would conflict with
the separate PHY device.

SuggestedRemedy

Several things are required:
(1) clearly define the start and end points for measuring latency
(2) include support for cases where PHY is integrated with the MAC or in a separate device
(3) For 10G PHYS clearly specify end points for various scenarios (a) MAC device with
integrated PHY (b) MAC device with DTE XGXS (c) PHY device with PHY XGXS
(4) for MAC device with DTE XGXS specify registers for latency from XGXS to xMII
(5) for PHY device with XGXS specify latency (using currently defined registers) from MDIO
to XGXS
(6) for MAC device with integrated PHY specify latency from MDI to xMII

Update 90.6 and 90.8, as well.

Comment Type **E**   *Comment Status* **D**   *802.1AS*
   Consistency -- When refering to IEEE Std 802.3, some times we say "this standard" in
   some other clauses. Please use the consistent way, IEEE Std 802.3, IEEE 802.3, etc
   variations are used in this clause. Also IEEE Std P802.1AS versus IEEE Std P802.1AS-
   201x has specific meaning. -201x specifies that particular revision of the std, while
   802.1AS would refer to the std itself. The context of this std is to refer to IEEE Std
   802.1AS.

SuggestedRemedy

   Consider and make use of the term consistent.

Proposed Response   *Response Status* **W**

   PROPOSED ACCEPT IN PRINCIPLE.
   See also comment #279 for resolution in relation with 802.1AS.
   References to 802.3 are consistent with the style guide i.e.

   When using standard designations in text, two simple rules apply:
   a) When referring to the document, i.e., the standard that is published, IEEE Std 1234
   should be used. For example, "IEEE Std 1234 should be referenced for more information
   on protocol layering."
   b) When referring to the technology that the document standardizes, IEEE 1234 should be
   used. For example, "IEEE 1234 protocol layering is employed in the previous example."

As the amendment will support time synchronization protocols other than IEEE P802.1AS, I believe the title and introduction of Clause 90 should be similar to the title of the amendment, '.. parameters to support time synchronization protocols'.

SuggestedRemedy

Change:

[1] 'Ethernet Support for the IEEE Std P802.1AS-201X Time Synchronization Protocol (TimeSync)' to read ' Ethernet Support Time Synchronization Protocols'.

[2] ' The optional support for the IEEE Std P802.1AS-201X Time Synchronization Protocol (TimeSync) ..' to read 'The optional support Time Synchronization Protocol (e.g. as for the IEEE Std P802.1AS-201X) ..'.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
[1] 'Ethernet Support for the IEEE Std P802.1AS-201X Time Synchronization Protocol (TimeSync)' to read ' Ethernet Support for Time Synchronization Protocols'.

[2] ' The optional support for the IEEE Std P802.1AS-201X Time Synchronization Protocol (TimeSync) ..' to read 'The optional support for time synchronization protocols (e.g. IEEE P802.1AS, IEEE Std 1588v2) ..'. Also see comment #296

Cl **90**   *SC* **90**   *P* **21**   *L* **13**   # 210
Law, David   Hewlett-Packard

Comment Type **T**   *Comment Status* **D**   90.1

It is the interface that supports Time Synchronization Protocols at various rates. In addition refereeing to the 'existing specification' once this amendment has been folded in to the base standard will seem a bit odd.

SuggestedRemedy

Suggest this paragraph should be changed to read:

'The Time Synchronization Service Interface (TSSI) supports the IEEE 802.3 MAC operation at data rates of 10 Mb/s , 100 Mb/s, 1000 Mb/s, 10 Gb/s, 40 and 100 Gb/s. Support for future data rates is depend on the support of the gRS sublayer as defined in 90.5.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
See comment #296 for changes to 90.1

Cl **90**   *SC* **90.1**   *P* **21**   *L* **7**   # 296
Law, David   Hewlett-Packard

Comment Type **T**   *Comment Status* **D**   90.1, 90.4, 90.5

In general I think that this clause should be structured more like Clause 79, and an overview provided as to how the TS Client should use the information provided by the TSSI. It should also be made clear that the TSSI can support any protocol that needs to know the ingress and egress times of packets.

Please get rid of lists that will have to modify ever time we implement a new speed as well as defining the new term gRS. The notes in 90.4.1 should be removed as this information is stated elsewhere in the standard. The note in relation xMII should be moved under the figure and made the same as the similar note under Figure 1-1.

In addition the text states that ' Nothing in the existing specification prevents support of the optional TimeSync capability in PHYs operating at 10 Mb/s, 100 Mb/s, 1000 Mb/s, 10 Gb/s or even 40/100 Gb/s. Support for future PHYs ..'. While the RS is part if the Physical Layer it is not part of the PHY (see right hand side IEEE Std 802.3-2008 Figure 1-1 marked >= 100 Mb/s).

SuggestedRemedy

[1] Replace the whole of 90.1 with:

90.1 Introduction

This clause specifies the Time Synchronisation Service Interface (TSSI). The TSSI can be used to support any protocol that requires knowledge of packet egress and ingress time.

[2] Replace 90.4.1 with:

90.4.1 Introduction

This subclause specifies services provided by an extension to the Reconciliation Sublayers specified elsewhere in this standard.

[3] Insert new 90.4.1.1 and 90.4.1.2 as follows:

90.4.1.1 Interlayer service interfaces

Figure 90-1 depicts the TS Client and the RS interlayer service interfaces.

[Include Figure 90-1 here]

Add note to figure that reads 'NOTE-In this figure, the xMII is used as a generic term for the Media Independent Interfaces for implementations of 100 Mb/s and above. For example: for 100 Mb/s implementations this interface is called MII; for 1 Gb/s implementations it is called GMII; for 10 Gb/s implementations it is called XGMII; etc.'.

Cl **90**   Page 13 of 30
SC **90.1**   14/09/2010 15:00:25

90.4.1.2 Responsibilities of TS Client.

The TS Client can use the indication of egress and ingress of packets provided by the TSSI, combined with knowledge of the protocol frames, to select the egress and ingress times relevant to the protocol. Which frames are of interest to any particular protocol is beyond the scope of this standard.

The TS Client can use the indication of the egress and ingress of packets at the xMII provided by the TSSI, combined with the information provided by the TimeSync PHY transmit latency and TimeSync PHY receive latency if available (see 45.2.1.100, 45.2.1.101 and 45.2.1.102), to determine the egress and ingress of packets at the MDI.

[5] Replace 90.4.2 through 90.4.2.3 with:

90.4.2 TS Client service interface

The following specifies the service interface provided by the RS to the TS Client. These services are described in an abstract manner and do not imply any particular implementation. The model used in this service specification is identical to that used in 1.2.2.

The following primitives are defined:

TS_TX.indication
TS_RX.indication

[6] Replace 90.5 with:

90.5 Reconciliation Sublayer (RS)

For the purpose of the optional TimeSync capabilities, two new functions are defined in this subclause, namely TS_SFD_Detect_TX (see 90.5.1) and TS_SFD_Detect_RX (see 90.5.2), which are responsible for generation of the TS_TX.indication and TS_RX.indication service primitives, as defined in 90.4. Figure 90- 2 presents the TS_SFD_Detect_TX and TS_SFD_Detect_RX functions and their location within the RS sublayer.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

[1] Replace the whole of 90.1 with:

90.1 Introduction

This clause specifies the optional Time Synchronisation Service Interface (TSSI). The TSSI can be used to support any protocol that requires knowledge of packet egress and ingress time.
TimeSync is defined for full-duplex mode of operation only. It supports MAC operation at different data rates. The MII (Clause 22), GMII (Clause 35), XGMII (Clause 46), XGMII (Clause 81) and CGMII (Clause 81) specifications are all compatible with the gRS sublayer

defined in 90.5.

[2] Replace 90.5 with:

90.5 generic Reconciliation Sublayer (gRS)
In the scope of this clause, the term generic Reconciliation Sublayer (gRS) is used to denote any type of IEEE Std 802.3 Reconciliation Sublayer (RS) used to interface MAC with any type of PHYs supporting the optional TimeSync capability through the xMII.

For the purpose of the optional TimeSync capabilities, two new functions are defined in this subclause, namely TS_SFD_Detect_TX (see 90.5.1) and TS_SFD_Detect_RX (see 90.5.2), which are responsible for generation of the TS_TX.indication and TS_RX.indication service primitives, as defined in 90.4. Figure 90- 2 presents the TS_SFD_Detect_TX and TS_SFD_Detect_RX functions and their location within the RS sublayer.

Remaining points per Suggested Remedy

[3]

Make these additional changes to 90.5.1 to read as follows "The service primitive across the TSSI i.e. TS_TX.indication shall be generated (SFD=DETECTED) only when the SFD is detected on the transmit signals of the xMII."

Make these additional changes to 90.5.2 to read as follows "The service primitive across the TSSI i.e. TS_RX.indication shall be generated (SFD=DETECTED) only when the SFD is detected on the receive signals of the xMII."

Marris, Arthur   Cadence

Comment Type **T**   *Comment Status* **D**   90.1
Use of words such as "existing" is not good in a standard that will be used many years from now.

SuggestedRemedy
Change:
"TimeSync supports the IEEE 802.3 MAC operation at various data rates. Nothing in the existing specification prevents support of the optional TimeSync capability in PHYs operating at 10 Mb/s, 100 Mb/s, 1000 Mb/s, 10 Gb/s or even 40/100 Gb/s. Support for future PHYs depends on the availability of the gRS sublayer as defined in 90.5."

To:
"TimeSync supports the IEEE 802.3 MAC operation at different data rates. The MII, GMII, XGMII, XLGMII and CGMII specifications are all compatible with the gRS sublayer defined in 90.5."

Proposed Response   *Response Status* **W**
PROPOSED ACCEPT IN PRINCIPLE.

Comment Type **TR**   *Comment Status* **D**   90.1
The word "even" adds no value. In addition, we should get away from the practice of listing a whole slew of operating speeds so that future projects don't feel compelled to come back and edit the list when they add a new operating speed.

SuggestedRemedy
Replace the second paragraph of 90.1 with a single sentence as follows:
The optional TimeSync function can be supported at any data rate defined by IEEE Std 802.3, depending on the availability of the gRS sublayer defined in 90.5.

Proposed Response   *Response Status* **W**
PROPOSED ACCEPT IN PRINCIPLE.
See comment #296 for changes to 90.1
Remove the instances of the word "optional" in the remainder of Clause 90.

Comment Type **E**   *Comment Status* **D**   *90.1*

Given that IEEE Std 802.3ba-2010 is an approved amendment to the standard and the time sync capability seems to depend on the existance of the gRS layer rather than the signaling rate, it appears that this capability applies equally to 40 and 100Gb/s as it does to the other rates.

SuggestedRemedy

Change
"PHYs operating at 10 Mb/s, 100 Mb/s, 1000 Mb/s, 10 Gb/s or even 40/100 Gb/s"
to
"PHYs operating at 10 Mb/s, 100 Mb/s, 1000 Mb/s, 10 Gb/s, 40 Gb/s, or 100 Gb/s"

John Abbott   Corning Incorporated

Comment Type **E**   *Comment Status* **D**   *90.1, 90.3, 90.2*

Line 15 "even 40/100 Gb/s". The "even" should be removed, it seems non-technical,subjective, and will make this look outdated in 5-10 years. More broadly, sections 90.1-90.2-90.3 don't give an adequate explanation of why this applies to all PHYS (from 10m to 20km) and all data rates.

SuggestedRemedy

(a) edit "even" in line 15. (b) in introduction explain which application provided the initial need for this change, and then explain that the change is expected to apply broadly in the future, even beyond 40/100 if the gRS sublayer is available.

Comment Type **T** *Comment Status* **D**   90.2

The stated objective does not match what is on the website as the project objectives.

Moreover, there are two schools of thought on project objectives. One is to include the project objectives. The other is not to. I recomend the later as it makes it easier and less confusing to maintain and/or ammend in a future project.

In this case, since this might be a more refined goal of the clause, perhaps the easiest thing is to rename the section to overview and just use the word "goal" in the text of the section avoiding the term objective all together.

SuggestedRemedy

Rename the section to overview and just use the word "goal" in the text of the section avoiding the term objective all together

Booth, Brad   AppliedMicro

Comment Type **ER** *Comment Status* **D**   *TS or TSSI*

There seems to be some confusing use of Time Synchronization (TS) service interface and TSSI and TimeSync. From my interpretation, TimeSync refers to the protocol. TS is an abbreviation for Time Synchronization. And TSSI is an abbreviation for Time Synchronization Service Interface.

SuggestedRemedy

Be consistent in the use of the abbreviations. For example, don't use Time Synchronization (TS) service interface when TSSI or the full name is required. I found that there are multiple uses of Time Synchronization (TS) service interface, when the first use of time synchronization to define TS should have been sufficient.

This comment is Out of Scope as the comment and the suggested remedy field submitted
were blank. This therefore is not a comment on the proposed standard. The submitter has
been contacted by email about this but at this time has not replied.
This ruling is based on subclause 5.4.3.3 'Comments in the ballot' of the IEEE-SA
Standards Board OpsMan, which reads reads that 'Comments not based on the proposed
standard may be deemed out-of-scope of the standards balloting process by the Sponsor.'

Cl **90**	*SC* **90.4.3.1.1**	*P* **11**	*L* **32**	*#* 230

Frazier, Howard   Broadcom Corporation

Comment Type **TR**   *Comment Status* **D**   *SFD detect*

The SFD parameter should never have an undefined value, because "undefined" allows the
parameter to have any value, including "DETECTED". Rather, the
SFD parameter should always have one of two values, "DETECTED" or "NOT
DETECTED". This is analogous to the descriptions of the PLS indications in Clause 6.

SuggestedRemedy

Change the description of the semantics of the primitive to read:

The semantics of the primitive are as follows:

TS_TX.indication(SFD)

The SFD parameter can take either of the following two values: DETECTED or NOT
DETECTED. When asserted (SFD = DETECTED), the TimeSync Client is notified that a
valid SFD was detected by the gRS sublayer TS_SFD_Detect_TX function (see 90.5.1) in
the xMII transmit signals. Otherwise, the SFD parameter takes the value NOT Detected.

Also make the corresponding change in 90.4.3.2.1.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change the description of the semantics of the primitive to read:

The semantics of the primitive are as follows:

TS_TX.indication(SFD)

The SFD parameter can take only one possible value i.e. DETECTED. When asserted
(SFD = DETECTED), the TimeSync Client is notified that a valid SFD was detected by the
gRS sublayer TS_SFD_Detect_TX function (see 90.5.1) in the xMII transmit signals.

Also make the corresponding change in 90.4.3.2.1.

See comment #296 for related changes to 90.5 and subsections

Comment Type **T**   *Comment Status* **D**   SFD detect, 90.5

TS_TX.indication(SFD) semantics say that the SFD parameter can either be DETECTED
or undefined. In other RS's, having an "undefined" parameter is not common. When SFD
is not detetced, prefer a defined value that indicates SFD not detected. Also, in 90.5, the
service primitice is only generated when SFD detected, undefined otherwise. Seems more
consistent with other clauses to have the primitive always generated and take on two
known values.

SuggestedRemedy

Change "undefined" to "NOT_DETECTED" in line 32 and line 36.
Also in 90.5.1 delete the second paragraph (lines 42-43) which begins with "The service
primitive..."

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Brown, Matt   AppliedMicro

Comment Type **TR**   *Comment Status* **D**   Open, SFD definition in RS

It is not clear what is meant by the SFD. SFD is explicitly specified in 3.1.1 and is normally
detected by the MAC layer. However, each RS has a mechanism to detect the beginning of
a packet. To simplify the implementation SFD in this context should be defined to employ
the native method of detecting start of frame.

SuggestedRemedy

Clearly define that "valid SFD" is based upon mechanism native to RS as opposed to rules
for detecting a valid SFD specifed for the MAC.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type **T**   *Comment Status* **D**   SFD corrupted

What if the received SFD is corrupted?

SuggestedRemedy

The impending location of the SFD in most cases is detectable due to the preamble. Is it
worth considering adding an ERROR value to this variable?

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
This isn't an issue as an errored packet, while potentially generating a TSSI indication, will
be discarded by the MAC. Since it is the task of the TS client to (see new 90.4.1.2 text in
#296) to associate TSSI indications with frames of interests, a TSSI without a frame, which
is what will happen in this case, will not cause a problem.

I have a problem with designation "gRS" and its expansion "generic Reconciliation
Sublayer" in terms of the capitalization being used. The use in this clause is intended to be
reserved word, a precisely defined term and therefore should be treated as a proper noun.
In this form it will be difficult to differentiate it (in the clause 90 meaning) from a reference
elsewhere in the standard to a "generic" (small "g") RS that might be made.

SuggestedRemedy
Change to: "GRS" and "Generic Reconciliation Sublayer" throughout the draft.

Proposed Response   *Response Status* **W**
PROPOSED REJECT.
Clause 1.4 contains even now "xDSL" which is also a well defined term, and a proper noun
under the use cases indicated in the comment.

Diab, Wael   Broadcom

Comment Type   **ER**   *Comment Status* **D**   *90.6 & 90.7*

I believe the intent of this section is to point the reader to Clause 30 for management. The current structure suggests that this is providing some sort of definition for the objects and classes, furthermore the references are one more place that could go out of sync with C30 for maintenance (the information is redundant).

Same is true for 90.7

SuggestedRemedy

Suggest combining 90.6 and 90.7 into one section called "Overview of Managment Features". Provide some infromative text on what things are defined in the clauses like managed objects, registers and classes without reproducing the entire lists (a good example is all the registers listed in C45) and simply point to C30 and C45.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.
Merge 90.6 and 90.7, removing references to clause 30 in 90.6 text and removing referenes to clause 45 subclauses in 90.7 text.

Thompson, Geoff   GraCaSI

Comment Type **TR**   *Comment Status* **X**   *Open, latency precision*
It may be true that: The method used for the PHY latency measurement and the the
process of selecting the minimum and maximum PHY latency values are outside the scope
of this specification.
It is NOT true that the tolerances on those values are not in scope. Without required and
standardized tolerances on measured vs. actual values, there can be no assurance of
multi-vendor interoperability.

SuggestedRemedy
Establish and document the required accuracy on maximum and minimum latency
measurements that is needed to support the higher level interaction functions in 802.1AS
and include them in this sub clause.
(Since you seem to be gathering a max and min count for each as your data, you might be
better off to define latency in count units rather than ns and then define the tolerances on
the clock driving the counter.)

Proposed Response   *Response Status* **W**

Law, David   Hewlett-Packard

Comment Type **E**   *Comment Status* **D**   *page numbering*

As stated in the editor's notes, in IEEE 802.3 we don't use lower case Roman numeral
page numbers for the introduction text even though that is what the IEEE-SA Style Guide
requires for published standards.

SuggestedRemedy

Replace the lower case Roman numeral page numbers with Arabic page numbers in the
introduction so that the page numbers match the pdf page numbers.
