Ran, Adee   Cisco systems

Comment Type   **TR**   *Comment Status* **A**   *AC CM noise*

"AC common-mode RMS output voltage (max)" specification of 17.5 mV is not feasible for high-volume, multi-port products. The common-mode output may include a component correlated to the differential output, e.g. from mode conversion on the host channel. A module receiver is expected to be quite tolerant to a correlated common-mode signal.

As suggested in ran_3ck_adhoc_20210630, there are two reasonable alternatives:
a) increase the allowed RMS voltage to 30 mV (as is allowed for the CR transmitter measured on an HCB - likely the same point - and where the common-mode concern is greater due to conversion in the cable assembly).
b) Keep the 17.5 mV specification but only for the component uncorrelated to the differential signal; use the linear fitted pulse response method (which is already referred to in 120G.5.2) to calculate the linear fitted pulse response characteristics of the common-mode output, and define the AC common-mode noise as the RSS of sigma_n and sigma_v.

Note: This comment is only about the host output; module output is more controlled and modules can be designed to have low mode conversion so the correlated component is expected to be small. Modules should not be allowed to generate 30 mV RMS, so if option a is chosen, the module output specification should not be changed.

SuggestedRemedy

Preferably implement option a in the comment.

Response   *Response Status*   **U**

ACCEPT IN PRINCIPLE.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

Comment 121 proposes to increase the value to 25 mV.

This comment proposes to either:
(a) change the value to 30 mV
(b) change the parameter to relate to only the uncorrelated noise
There is not sufficient evidence that the correlated noise is indeed tolerable by the receiver (e.g., conversion from CM to DM in receiver might be non-linear or CM might have much larger channel transit time than DM)

The resolution to comment #123 indicates there is not consensus to make the change proposed in option (b), above.

Following straw polls #3 and #4, there was consensus to close this comment changing the value to 25 mV.

Change the AC common-mode RMS output voltage (max) for module output and host

output to 25 mV.

Straw poll #3, pick one (direction)
Straw poll #4, Chicago rules (direction)
To address comments #46 and #121, for the module output and host output AC CM noise (max) I would support:
A: no change
B: change to 25 mV
C: change to 30 mV

Transition time host requesting short mode or long mode is for TP4

SuggestedRemedy

Please revert to 10 ps in draft D2.0, please move this parameter to TP4 table 120G-3

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment relates to the host output transition time specified in Table 120G-1.

Separate values for host long and short modes were added per D2.1 comment #188.

The justification was that the host input and host output PCB insertion loss will likely be similar, which is reflected in the transition times chosen for the host input crosstalk calibration. This must also be explicitly allowed and constrained at the hout output.

However, it would be helpful in Table 120G-1 to point to the subclause that defines long and short modes.

Add a footnote to the sub-rows for long and short modes in Table 120G-1 pointing to 120G.3.2.1.

Cl **120G**   *SC* **120G.3.1.2**   *P* **251**   *L* **41**   # 100

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **A**   *ERL Tfx*

This fixed time value of time-gated propagation delay Tfx is unworkable because the HCB is defined by its loss not its transit time. While HCBs for connectors with few lanes such as SFP+ may be constructed from PCB, those for connectors with many lanes such as QSFP-DD are challenged by fanout and may use cabled construction with the same loss and much greater delay than a PCB. The discontinuity at cable-PCB interface which is in the connector body, several inches from the coax connector and near the module connector, should be windowed out just like the coax connector itself, it's not part of the DUT. The HCB transit time is known, just as its loss is, so we can use that in the windowing. Notice that in 163 and 120F, "The value of Tfx is twice the delay from TP5v to TP5", so it's known there.

SuggestedRemedy

Change 0.3 ns to twice the delay between the test fixture test connector and the test fixture host-facing connection minus 0.2 ns, or 85% of the delay. This gives the cabled HCB designer the length of the module PCB less about 30 mm to position up to 16 coax-PCB transitions. Make a similar change in 162.9.3.5 (HCB for CR).
Make similar changes in 120G.3.2.3 and 162.11.3 (MCB).

Response   *Response Status* **C**

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *pattern table*

As this annex uses several test patterns like an optical PMD, it should have a table of test patterns giving the pattern number, which this draft lacks, and description, and reference for definition.

SuggestedRemedy

Copy Table 167-10, Test patterns, leaving out the rows that don't apply. Refer to the table from elsewhere in the annex to reduce clutter end repetition.

Response   *Response Status* **U**

REJECT.

Table 167-10 may be found in 802.3db.

It is not clear that the proposed table with pattern numbers will improve the draft all things considered.

It can indeed reduce some clutter for cases where multiple patterns are listed for a particular test step, but not in cases where a single pattern is referenced. It is more convenient to the reader to list the pattern names; the reader would otherwise have to memorize the relationship between pattern numbers and the pattern they represent. The test pattern names line up better with the test equipment controls.

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *MO VEC/EH*

If the eye height limit is the same at long near end as at long far end, there is huge margin at near end and the implementer is encouraged to optimise for far end or beyond, only limited by the NE VEC spec, while we want modules to be set up consistently, for the full range from near to far. EH is naturally larger at NE for a well set up output.

SuggestedRemedy

Increase the eye height, long mode near end, by 3 dB from 15 mV to 21 mV

Response   *Response Status* **U**

REJECT.

This comment pertains to the module output eye height (min) for long mode, near end.

The comment does not provide sufficient evidence that the proposed change is necessary.

Cl **120G**   *SC* **120G.3.2**   *P* **253**   *L* **11**   # 97

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *MO VEC/EH*

The driver swing has to be aggressively reduced from 600 mV pk-pk to deliver only 15 mV at near end, short mode. 120E has 70 mV, and D1.4 had 24 mV, ghiasi_3ck_adhoc_01a_042121 shows 35 mV (before Vpkpk was reduced). Yet a host can usefully optimise for e.g. different crosstalk or noise if given a reasonable signal strength. A NIC has no high-loss ports so it can do this even if a switch won't. There is room to increase this weak signal without overloading the receiver. Also, making the limits more like reality encourages more consistent module setup across the industry.

SuggestedRemedy

Increase the eye height, short mode near end, by 1.1 dB from 15 mV to 17 mV

Response   *Response Status* **U**

REJECT.

This comment pertains to the module output eye height (min) for short mode, near end.

The comment does not provide sufficient evidence that the proposed change is necessary.

Comment Type **TR**   *Comment Status* **A**   *MO DC CM voltage tolerance*

footnote b says "Specification includes effects of ground offset voltage." - what does it mean?

It is unclear why the module needs a specification of DC common-mode voltage at all, given that its output is AC coupled (per 120G.1). Without AC coupling in the module, the limits given in this table are not reasonable.

SuggestedRemedy

Clarify what the quoted sentence mean, or delete it.

Consider removing the DC common mode voltage specification.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

The comment is referring to module output "DC common-mode voltage" specifications which are intended to define a tolerance for the module output to host DC bias voltage. A DC common-mode voltage tolerance specification is required as the module output, whether it be a discrete capacitor or decoupling on the die, must tolerate the DC common-mode voltage applied by the host input. This is a necessary requirement and thus should not be deleted. However, this specification as written is difficult to interpret.

Implement slide 16 of brown_3ck_02b_0721 with editorial license.

Figure 120G-7 could be improved with relation of module DUT, switch, and there is no need for DC blocks on the output of HCB

SuggestedRemedy

Please center MCB with HCB above and module DUT under to make it more clear that both are inserted into MCB, remove DC blocks from HCB, and improve the switch figure

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Implement the suggested remedy with editorial license, except leave the DC blocks in diagram.

Cl **120G**   *SC* **120G.3.2.2.1**   *P* **254**   *L* **51**   # 102

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *MO SI host reference channel*

The near end and far end should be placed far enough apart so that the module implementer has little choice what emphasis to use, so that all modules are set up similarly. As short is easier than long, this means that far minus near (mm or dB) for short should be at least as much as far minus near for long. As real host channels are not exactly like the theoretical reference host channel, there should be a healthy overlap of short and long to give the host room for its implementation. D2.0's 160 mm delivered on both these criteria, D2.1's 133 mm doesn't.

SuggestedRemedy

Change 133 to 150, change 80 to 90

Response   *Response Status* **U**

REJECT.

The comment does not provide sufficient justification for the proposed changes.

There may be some benefit to balancing the length range between short and long modes. Further analysis is encouraged.

Ran, Adee   Cisco systems

Comment Type **T**   *Comment Status* **A**   *HI SI method*

Unlike the jitter levels in step c, the initial signal levels in the calibration procedure are not defined. Using inappropriately low levels can result in bad jitter measurement in step c.

To achieve good jitter measurement, the initial output levels should be as high as possible without exceeding the differential peak to peak specification.

Also applies in module stressed input test, 120G.3.4.2.2.

SuggestedRemedy

Add guidance to step a to use initial signal level as high as possible such that the differential peak-to-peak input voltage tolerance given in Table 120G–9 is not exceeded.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Ran, Adee   Cisco systems

Comment Type **T**   *Comment Status* **D**   *HI SI SJ*

The host stressed input calibration is performed with PRBS13Q and with SJ at 40 MHz
(case F of table 162-16). This frequency is not coherent with the PRBS13Q cycle, so the
combination of SJ and ISI can create different signal statistics depending on the alignment
of the SJ cycle and the PRBS13Q cycle. This can create variability in eye metrics and may
require repeated or long measurements.

If the calibration is done with an SJ whose frequency is coherent with the PRBS13Q cycle,
data collection can be done with a period which has an integer number of PRBS13Q cycles
and integer number of SJ cycles. This can reduce the variability of the calibration. The
different frequency would not affect the test which is performed with much longer pattern
anyway.

It would be preferable to use a frequency of $f\_b*6/8191$ (approximately 38.915 MHz)
instead of 40 MHz during calibration. This would enable more repeatable calibration if the
data is collected from an integer multiple of 6 PRBS13Q cycles. The frequency difference
should have little effect as the proposed frequency is still far out the reference CRU
bandwidth.

Also applies to module stressed input calibration, 120G.3.4.2.2.

SuggestedRemedy

Change item b from "Sinusoidal jitter is applied with frequency and amplitude per case F in
Table 162–16." to:

"Sinusoidal jitter is applied with a frequency of at least 38 MHz and pk-pk amplitude of 0.05
UI."

Add the following informative note after the list:
NOTE—It is recommended to use a sinusoidal jitter frequency which is coherent to the
frequency of the PRBS13Q pattern, such as $f\_b*6/8191$ where f_b is the signaling rate of
the pattern generator (approximately 38.915 MHz) and calculate eye height and VEC from
6N full cycles of the sinusoidal jitter, where N is an integer.

Apply similar changes in 120G.3.4.2.2.

Implement with editorial license.

Dawe, Piers   Nvidia

Comment Type **T**   *Comment Status* **R**   *LATE*

This sentence used to say "The pattern may be changed to a valid 100GBASE-R,
200GBASE-R, or 400GBASE-R signal for amplitude calibration and the stressed input
test". The same sentence was used for host stressed input calibration with target
amplitude and transition time, and module stressed input calibration with target amplitude
and slew time. It wasn't as clear as it could have been: crosstalk pattern or victim pattern?
Amplitude calibration of crosstalk or victim? I believe it meant that the crosstalk pattern
could be changed to a long one when calibring the eye height of the victim. CEI
16.3.10.3.1 says "The crosstalk signal is calibrated at TP4 or TP1a using a QPRBS13-CEI
pattern, then the pattern is changed to QPRBS31-CEI for the test".

SuggestedRemedy

Change "The pattern" to "The crosstalk pattern", change "amplitude calibration" to
"stressed signal eye height and VEC calibration". Also in 120G.3.4.2.2 step e.

Dawe, Piers   Nvidia

Comment Type **T**   *Comment Status* **R**   *LATE*

There's a problem with identifying which lanes are relevant. For "The host electrical output
is enabled on all lanes with any of the patterns above", this is to include realistic crosstalk
so it could include all 8 transmit lanes of a QSFP-DD, or maybe all the output lanes on the
host if it makes a difference. While for "The host BER is the average of the BER of each of
its lanes", only the lanes in the PMD under test (1, 2 or 4 lanes) are relevant. "Module
BER" in 120G.3.4.2.3 is even more open to misinterpretation because we are so clear how
many lanes a module has. But, terminology for this has been set up: the term "interface
BER" occurs 19 times in section 6, and is defined in 86.8.2.1, 86.8.4.7, 86.8.4.8, 95.8.1.1...

SuggestedRemedy

The relevant BER is the interface BER, which is the average of the BER of each of the
lanes in the PMD under test.
If the test is performed with PRBS31Q, the BER of a PMA lane may be calculated using
the bit error counter in the PMA test pattern checker (see 120.5.11.2.2) as the number of
bit errors divided by the number of received bits.
If the test is performed with scrambled idle or another valid 100GBASE-R, 200GBASE-R,
or 400GBASE-R sequence, the interface BER may be calculated using the host FEC
decoder error counters (see 91.6 and 119.3.1), as the number of FEC symbol errors
divided by the number of received bits.
Similarly in 120G.3.4.2.3.

Ran, Adee   Cisco systems

Comment Type **TR**   *Comment Status* **A**   *MI reference channel*

The test setup includes "Frequency-dependent attenuation representing the host channel" but the frequency dependence is not defined. The only requirement is given in step f of 120G.3.4.2.2 as 18.2 dB at 26.56 GHz - a single frequency. This can be implemented by a notch filter - obviously not what we intend.

The attenuator should be specified across a wide frequency range. The suggested remedy is to use a reference PCB model. Alternatively, a frequency mask can be used.

SuggestedRemedy

With editorial license, define the frequency-dependent attenuation based on the PCB model of 162.11.7.1 (as in Annex 163B) with zp=461 mm (value scaled from Annex 163B to create 18.2 dB at 26.5625).

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Implement the suggested remedy with editorial license and with the following additional considerations:
- retain text stating 18.2 dB @ 26.5625 GHz
- mention the channel should approximate this prescribed response
- include figure with plot of IL curve

REJECT.
This comment was received after the ballot closed.

Cl **120G**   *SC* **120G.3.4.2.2**   *P* **262**   *L* **2**   # 135

Dawe, Piers   Nvidia

Comment Type   **E**   *Comment Status*   **D**   *LATE*

"transition time ... at the input to the frequency-dependent attenuator", "jitter profile of the signal at the output of the pattern generator". These are the same place and the style guide says to use the same name for the same thing every time. Also the frequency-dependent attenuation/attenuator is not always present. By the way, 120G.3.3.4.2 says "at the pattern generator output".

SuggestedRemedy

Change "at the input to the frequency-dependent attenuator" to "at the output of the pattern generator (TP4a)".

Dawe, Piers   Nvidia

Comment Type   **T**   *Comment Status*   **R**   *LATE*

This is misleading: "For the high-loss case, the reference receiver CTLE is limited to settings where gDC + gDC2 is less than or equal to -13 dB. This restriction does not apply for the low-loss case." Even the previous text, "The CTLE setting, gDC+gDC2, has to be less than or equal to -13 dB" was misinterpreted to mean that there is no constraint on gDC + gDC2. Yet the limits for the appropriate test point in Table 120G-11 still apply.

SuggestedRemedy

Change "Eye height and VEC are measured at TP1a as described in 120G.5.2." to "Eye height and VEC are measured at TP1a as described in 120G.5.2, with an addtional constraint for the high-loss case: the reference receiver CTLE is limited to settings where gDC + gDC2 is less than or equal to -13 dB.
Alternatively, modify Table 120G-11 to add the rule there.
Delete "For the high-loss case, the reference receiver CTLE is limited to settings where gDC + gDC2 is less than or equal to -13 dB. This restriction does not apply for the low-loss case."

Ran, Adee　　　　　　　　　　Cisco systems

Comment Type **TR**　　*Comment Status* **R**　　　　　*signal level (CC)*

This clause is referred to in Table 120G-1 and Table 120G-3 for the parameter differential PtP output voltage (max), among others.

The content is only a reference back to 120E.3.1.2: "The signal levels are as defined in 120E.3.1.2". 120E.3.1.2 does have a definition of differential signal but also states that "Unless otherwise noted, differential and common-mode signal voltages are measured with a PRBS13Q test pattern".

But PRBS13Q is not an appropriate signal for measurement of the PtP output voltage, because it has a maximum run length of 7 symbols and does not have any spectral content below 3 MHz. Much longer runs are possible in real data. Measurement with PRBS13Q over a lossy channel between the transmitter and the measurement point, without sufficient equalization, can thus yield peak-to-peak value lower than the value that real data would create.

Since there is no way to control the transmitter's swing or equalization, this may cause events of higher signal levels than the receiver expects, and cause periods of high BER, which can span many FEC symbols and cause uncorrectable codewords.

It is proposed to define the differential PtP explicitly as a requirement for any data pattern, and recommend to measure it using a pattern that contains low-frequency content, such as PRBS31Q or SSPRQ.

The definition of signal levels measurement using PRBS13Q also applies for CR/KR/C2C but in these cases the transmitter can be controlled to reduce the signal to an adequate level for the receiver, so it is less of an issue.

SuggestedRemedy

Replace the content of 120G.5.1 with the following:

"The definition of differential and common-mode signals can be found in 120E.3.1.2. The signal levels specifications for host and module outputs hold for any data pattern. It is recommended to measure differential peak to peak signal levels with PRBS31Q or SSPRQ test pattern."

Consider applying similar changes in 162, 163, and 120F, with editorial license.

Response　　　　　*Response Status* **U**

REJECT.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

The proposal to refer "any data pattern" is rather broad.

SSPRQ has been previously used only for optical transmitter testing and has no advantages for this test.
It is not clear that similar changes are warranted for 162, 163, and 120F since the insertion loss to the test point is smaller.

There was some agreement that this specifications should be improved but there was no consensus on a resolution.

[Editor's note: CC: 120F, 120G, 162, 163]

Straw poll #13 (decision)
I support closing comment #37 updating 120G.5.1 as follows:
"The signal levels are as defined in 120E.3.1.2, with the exception that differential signal voltage is measured with a PRBS31Q (see 120.5.11.2.2) test pattern or a valid 100GBASE-R, 200GBASE-R, or 400GBASE-R signal."

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **A**   *EO method*

This draft has a primitive rectangular eye mask spec with mask height = max(EHmin, EA/VECmax) and mask width = 0.1 UI, although it is described as a histogram. Measuring a diamond eye with a rectangular mask is an inefficient, inaccurate way of measuring signal quality and provides weak and uncertain protection against too much jitter. Its effective width is less than its actual because of the 1e-5 probability criterion and the inefficient shape.

De-weighting the sides of the histogram/mask would make this worse, equivalent to increasing the target BER by 10x or so. A higher VEC / smaller EH limit with the rectangular mask would allow more jittered and more varied signals, particularly for very short host channels (see Mike Dudek's work) that can have faster edges than higher loss ones. The target BER is not going to change.

We need an eye mask that's more eye shaped, so that a higher proportion of the samples are near the boundary and contribute to the measurement.

SuggestedRemedy

Change from a 4-cornered mask with corners at t = ts+/-0.05, V = y +/-H/2 to a 10-cornered mask with corners at t = ts+/-0.05, ts+/-1/16, ts+/-3/32, V = y +/-H/2, k +/-H*0.4, y. y is near VCmid, VCupp or VClow (vertically floating, as in D2.1).

H is max(EHmin, Eye Amplitude * 10^(-VECmax/20)). Eye Amplitude is AVupp, AVmid or AVlow, as in D2.1.

This simple scalable method can remain as the EH and VEC limits are revised. Scopes have been measuring with 10-sided masks for many years, it's not more difficult than a rectangular mask and gives better results.

Response   *Response Status* **U**

ACCEPT IN PRINCIPLE.

This comment is a restatement of D2.0 comment #127, which was rejected on the basis of insufficient justification and insufficient analysis to show equivalent or better interoperability.

Straw polls 5, 6, and 7 indicate there is no consesus to make the proposed change. However, the resolution to comment #39 addresses the concern expressed in this comment.

Ran, Adee   Cisco systems

Comment Type   **TR**   *Comment Status* **A**   *EO method*

As has been reported in calvin_3ck_adhoc_01_063021, the authors have been "unable to reliably close the calibration loop on TP1a at 12.5dB VEC with precision lab equipment" for insertion loss of 16.4 dB. This suggests that the VEC specification may be unfeasible.

Allowing a higher (worse) VEC for transmitters (host/module outputs) might pass bad receivers with very closed eyes, which will put more burden on receivers (even if the signal in stressed input test does not change, receivers will have to work with transmitters that have the same VEC due to other reasons, e.g. a "rectangular eye" closed by high noise that can't be equalized, rather than ISI).

Instead of lowering the VEC bar for transmitters, we should look at the definition of VEC and make it more suitable to the expected eye shape of good transmitters after processing with the reference receiver (this shape is not rectangular), taking into account the expected behavior of real receivers.

The calculation of VEC and EH from a CDF accumulated over $ts \pm 0.05$ UI gives the same weight to all phases. This makes sense if the receiver's phase is distributed uniformly in this window; it supposedly makes sense it we don't know where the receiver will sample within this region and account for sampling error. But the eye is not independent of the receiver - it is shaped by the receiver's equalization, and in the reference receiver we assume a certain behavior.

A receiver is expected to optimize its equalization (CTLE+DFE or equivalent) at the sampling point ts - this is part of the measurement procedure (currently steps k and l) - which would result in the maximum vertical opening being at ts. We should assume the average sampling phase is then ts; any difference between the optimized phase and the average phase is an implementation penalty that should be covered by the minimum EH.

A real receiver's CDR does not have a uniform phase distribution around its mean; the probability of sampling at either -0.05 UI or $+0.05$ UI from ts is smaller than the probability of sampling closer to ts. The rare events where the sample is taken far from ts contribute less to the average BER, so they should be weighted down in the calculation of the CDFs. Having equal weights as in the current method is overly pessimistic in both EH and VEC.

It is therefore proposed to apply a weighting function to the sampled data based on the phase.

SuggestedRemedy

A detailed proposal will be provided in a presentation.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.

Hence it is not within the scope of the recirculation ballot.

REJECT.

[Editor's note: Changed clause/subclause from 163/163.9.3.]

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

The following presentation was reviewed by the task force:
https://www.ieee802.org/3/ck/public/21_07/mellitz_3ck_01a_0721.pdf.
Resolve in conjunction with comment #46.

Based on straw poll #2, there is not sufficient consensus to implement the proposed changes.

Straw poll #1 (direction)
I would support the AC CM voltage test methodology in Comment #123 and the related presentation mellitz_3ck_01_0721.
Yes: 18
No: 6
Need more information: 13
Abstain: 3

Straw poll #2 (decision)
For the resolution of comment #123, I support adopting the AC CM voltage test methodology in Comment #123 and the related presentation mellitz_3ck_01a_0721.
Yes: 15
No: 16

Comment Type **E**   *Comment Status* **A**   bucket1

Now that we have established a consistent way of naming these return losses, let's make it easier for the reader to find them.

SuggestedRemedy

Please add "RLcc", "RLdc" and so on in the table rows as we do for ERL, VEC, vf and others, throughout the draft. Also in running text such as 162.9.3.6. Similarly Rpeak.

Response   *Response Status* **C**

ACCEPT.

Cl **162**	*SC* **162.9.3**	*P* **163**	*L* **18**	#	92

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   host/CA IL

The draft CR loss budget wastes over 3 dB in nearly every case. The relative range of host losses, 6.875/2.3 = 3:1, is too small for switch layout yet not needed for NICs.
The recommendation for the host traces plus BGA footprint and host connector footprint, 6.875 dB, compares very poorly with C2M's host insertion loss up to 11.9 dB, making passive copper to this draft expensive and unattractive for a switch, yet a full range of NICs can be made with only 3.75 dB. Server-switch links are asymmetric in form factor (e.g. QSFP-DD to 2 x QSFP) and will get made with an asymmetric loss budget, so it would be better for the standard to regularise what will happen anyway. C2M already has short and long ports.
This change would also benefit CR switch-switch links because the shortest ports would get credit for their low loss.
The symmetric budget is used for some designs under way and may be useful in future for LOM, so it is kept here, and the better way added.

SuggestedRemedy

3 classes of CR ports, host loss allocations of A 10, B 6.875, C 3.75 dB. B is as D2.1.
A connects to C, B to B or C, C to A, B or C.
Use 2 bits in Clause 73 Auto-Negotiation Link codeword Base Page to advertise A, B or C to the other end. In the Priority Resolution function, an A port ignores a 100G/lane Technology Ability Field bit from an A or B port, a B port ignores a 100G/lane Technology Ability Field bit from an A port.
In Table 162-10, add limits A and C for linear fit pulse peak ratio (min). Change text in 162.9.3.1.2 to refer to the table.
In Table 162-14, add columns for Test 2 (high loss), A and C, with test channel insertion loss: A: 6.875-3.75 = 3.125 dB lower (20.5 dB to 21.5 dB), and C: 10-6.875 = 3.125 dB higher (26.75 dB to 27.75 dB). No change needed for Test 1.
In 162A.4, add equations for IL_PCBmax and ILHostMax A and B and show them in Fig 162A-1 and 2. In 162A.5, add Value columns A, C in Table 162A-1 (ILChmin and ILMaxHost differ). Adjust figures 162A-3 and 4.

Response   *Response Status* **U**

REJECT.

D2.0 straw polls #6 and #7 indicated interest in exploring multiple CR port types. However, consensus is needed to make a change of this magnitude.

The following presentation was reviewed by the task force:
https://www.ieee802.org/3/ck/public/21_07/dawe_3ck_01a_0721.pdf

Based on straw poll #10, there is not sufficient consensus to implement the proposed changes in dawe_3ck_01a_0721.

Strawpoll #10 (direction)
I support P802.3ck specifying multiple CR host types such as in dawe_3ck_01_0721.

Dawe, Piers   Nvidia

Comment Type **T**   *Comment Status* **R**   *units (bucket3)*

The units for a ratio should be spelled out so the reader knows which of V/V, W/W or A/A, is meant.

SuggestedRemedy

Change the long dash to V/V. This may be desirable for some other ratios also, and in 163.

Response   *Response Status* **C**

REJECT.

The suggested remedy does not add clarity to the existing specification.

[Editor's note: CC: 162, 163]

Cl **162**   *SC* **162.9.3.1.1**   *P* **165**   *L* **5**   # 29

Ran, Adee   Cisco systems

Comment Type **TR**   *Comment Status* **R**   *Np value*

Here it is stated that Np takes the value 29, but this value is only effective for calculation of SNDR. Other invocations of this procedure, for vf and vpeak, use Nv=200 instead. Nv appears several times and looks like a parameter, but it is not - it is a value that replaces Np; this is not stated anywhere.

In the remaining use of the linear fit, for calculation of the equalizer coefficients used in 162.9.3.1.3, 162.9.3.1.4, and 162.9.3.1.5, it does not matter whether 29 or 200 UI are used. So Np=29 is important only for SNDR, which is the exception.

Having two parameters instead of one parameter which takes two values is unnecessary and confusing.

SuggestedRemedy

In 162.9.3.1.1, change "Np=29" to "Np=200".

In 162.9.3.3 (Output SNDR) change "with the exception that the linear fit procedure in 162.9.3.1.1 is used" to "with the exception that the linear fit procedure in 162.9.3.1.1 is used with Np=29 instead of 200".

In 162.9.3.1.2 (Steady-state voltage and linear fit pulse peak) delete "using Nv=200".

In 163.9.2.3 (Difference steady state voltage) delete "with Nv = 200".

In 163A.3.1.1 (Steady-state voltage and pulse peak reference values) change "Nv" to "Np" (3 times).

In 163B.2 (Characteristics) delete "With Nv = 200".

With editorial license, change any remaining occurrence of Nv to Np.

Response   *Response Status* **U**

REJECT.

The following presentation was reviewed by the task force at a previous ad hoc meeting. https://www.ieee802.org/3/ck/public/adhoc/july14_21/wu_3ck_adhoc_01a_071421.pdf.

There is no consensus to make the proposed changes at this time.

Ran, Adee   Cisco systems

Comment Type **TR**   *Comment Status* **A**   *vf method*

"The steady-state voltage vf is defined in 136.9.3.1.2, and is determined using Nv=200 and the linear fit pulse peak ratio calculated by the procedure in 162.9.3.1.1"

It is determined _from_ the linear fit pulse, and the _peak ratio_ is irrelevant here.

Also, 162.9.3.1.1 does not use the parameter Nv - it has Np which is 13. This is the subject of another comment.

SuggestedRemedy

Change this sentence to
"The steady-state voltage vf is defined in 136.9.3.1.2, and is determined from the linear fit pulse peak ratio calculated by the procedure in 162.9.3.1.1 with the exception that Np is replaced by Nv=200" or "with Np=200".

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

However, the proposed change is an improvement to the draft.

Change: "The steady-state voltage vf is defined in 136.9.3.1.2, and is determined using Nv=200 and the linear fit pulse peak ratio calculated by the procedure in 162.9.3.1.1."
To: "The steady-state voltage vf is defined in 136.9.3.1.2, and is determined from the linear fit pulse calculated by the procedure in 162.9.3.1.1 with the exception that Np and Nv are equal to 200."

Cl **162**   *SC* **162.9.3.1.2**   *P* **166**   *L* **5**   # 107

Dawe, Piers   Nvidia

Comment Type **T**   *Comment Status* **A**   *vf value*

Redundantly stating normative requirements is bad practice. Table 162-10 is normative.

SuggestedRemedy

Change "The steady-state voltage shall be greater than or equal to 0.387 V and less than or equal to 0.6 V" to "The steady-state voltage shall be within the limits given in Table 162-10", "meet the requirements specified in Table 162-10", or similar.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change: "The steady-state voltage shall be greater than or equal to 0.387 V and less than or equal to 0.6 V"
To: "The steady-state voltage shall meet the requirements specified in Table 162-10"

Cl **162**   *SC* **162.9.3.3**   *P* **167**   *L* **31**   # 78

Dudek, Mike   Marvell

Comment Type **T**   *Comment Status* **A**   *SNDR test response*

The measurement method for SNDR in 120D.3.1.6 uses a 33MHz filter bandwidth, which would take precedence over the statement that for Transmitter electrical characteristics "A test system with a fourth-order Bessel-Thomson low-pass response with 40 GHz 3 dB bandwidth is to be used for all transmitter signal measurements, unless otherwise specified as it is "otherwise specified".   This was probably not intended and there is potential ambiguity here that should be removed.   However as the Rx is only expected to have approximately the Nyquist bandwidth measuring SNDR to 40GHz may be excessive and we should consider using a narrower bandwidth.

SuggestedRemedy

Add a sentence. A test system with a fourth-order Bessel-Thomson low-pass response with 40 GHz 3 dB bandwidth should be used.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change the text in 162.9.3.3 to the following:
"The transmitter SNDR is defined by the measurement method described in 120D.3.1.6 with the exceptions that a test system with response as specified in 162.9.3 and the linear fit procedure in 162.9.3.1.1 are used."
Implement with editorial license.

TYPE: TR/technical required ER/editorial required GR/general required T/technical E/editorial G/general

Dawe, Piers Nvidia

Comment Type **T** *Comment Status* **R** *host/CA IL*

The poor max cable loss makes CR unattractive, while all NICs and some ports on any switch have host loss going to waste. Enabling longer cables on a minority of links is needed.
In the remedy, each host knows the other host's loss class through AN and the cable's loss class from its I2C compliance code, so the situation is just like any other CR scenario, no extra management features needed in the spec for the long cable class.

SuggestedRemedy

2 classes of cable, which could be called "short" (19.75 dB, as today) and "long", 19.75+2*(6.875-3.75) = 19.75+6.25 = 26 dB max (achievable cable length 3 m). Long cables connect port types C (see another comment) at both ends, short cables connect a valid combination of A, B, C.
In 162.11.2, cable assembly insertion loss, change text to refer to Table 162-17.
In 162.11.7.1.1, add zp = 30.7 mm for the "short" cable.
In Table 162A-1, add a column for the A-short-A scenario (ILCamax differs).
Illustrate in Figure 162A-4.

Response *Response Status* **C**

REJECT.

Per the resolution to comment #92, there are no changes to the host port types and this comment is overtaken by events.

Dudek, Mike Marvell

Comment Type **T** *Comment Status* **R** *CA RLcc*

As was pointed out in the unsatisfied comment # 177 against draft 2.0 the existing specification for common mode return loss limit effectively doesn't exist once the test fixture loss exceeds 0.9dB. The rejection however had a valid point that there is a potential issue up to 4GHz where the loss is low.

SuggestedRemedy

Change the limit to 1.8dB from 0 to 4GHz, 2.2-0.1*f from 4GHz to 40GHz.

Response *Response Status* **C**

REJECT.

The commenter provided the following update to the suggested remedy.
1.8   0.5</= f(GHz) </= 4 GHz
1.4+0.1*f   4< f(GHz) </= 30 GHz

The revised specification may result in currently posted channels failing.

The comment and updated suggested remedy does not provide sufficient justification to support the change to the draft.

Further analysis and a consensus proposal is required.

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *COM bbgmax*

The normalized DFE coefficient minimum limit bbmin for taps 3 to 12 is -0.03. It doesn't make sense that taps 13 to 40 could be worse, -0.05. If I have understood the data correctly, the example channels we have don't need this. (Remember, these are reference receiver limits not hard cable or channel limits anyway; a cable or channel can go beyond a tap limit if it makes up the COM another way, e.g. with acceptable crosstalk.)

SuggestedRemedy

Change bgmax 0.05 to bbgmax 0.05, bbgmax -0.03. Also in 163.

Response   *Response Status* **U**

REJECT.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

The following presentation showed that some backplane channels had floating tap coefficient values of <-0.03.
https://www.ieee802.org/3/ck/public/19_09/heck_3ck_01_0919.pdf
The comment does not provide an assessment of the impact to those channels.
[Editor's note: CC: 162, 163]

Cl **162**   *SC* **162.11.7**   *P* **183**   *L* **40**   # 96

Dawe, Piers   Nvidia

Comment Type **TR**   *Comment Status* **R**   *COM DFE RSS*

The spec allows a cable (not even the whole channel) to have its COM calculated with 9 taps in the range 13 to 24 clipped at +/-0.05 - which means that the channel's pulse response could be worse than +/-0.05 for all these 9 taps. That's a very bad cable! and not likely to get made: there won't be that many reflections in the same area. (Remember, these are reference receiver limits not hard cable limits anyway; a cable can go beyond a tap limit if it makes up the COM another way, e.g. with acceptable crosstalk.)
We don't need to provide all the receiver power and complexity to cope with unreasonably bad cables.

SuggestedRemedy

Use another DFE root-sum-of-squares limit for positions 13-24. Similarly in 163, but as 163 specifies the complete channel while 162 uses clean synthetic host traces, the limit should be higher.

Response   *Response Status* **U**

REJECT.

This comment does not apply to the substantive changes between IEEE P802.3ck D2.1 and D2.0 or the unsatisfied negative comments from the initial ballot.
Hence it is not within the scope of the recirculation ballot.

The suggested remedy is not complete nor has sufficient analysis been provided.

Dawe, Piers   Nvidia

Comment Type **T**   *Comment Status* **R**   host PCB IL

The recommended minimum insertion loss allocation for the transmitter or receiver differential controlled impedance PCBs, 2.3 dB, has been set the same as the 2.3 dB MCB PCB IL without evidence as to what happens with less loss. 2.3 dB is 1/3 of the maximum host trace loss (6.875 dB) which is too small a ratio to lay out a switch PCB. 92A.4 and 136A.4 use a ratio of 1/5.8 which allows more flexibility in host layout than 1/3 does. 120G has host insertion loss up to 11.9 dB (11.9/2.3 = 5.2/1, which is OK. If it wasn't wanted, the C2M max loss would not have been increased as it was).

SuggestedRemedy

Reduce the recommended minimum insertion loss allocation for the CR transmitter or receiver differential controlled impedance PCBs to whatever is justified. If the reasonable limit is a strong function of host package reflection, state whether the recommendation is for a "nominal worst" package, or what. If there is no justification, remove the recommendation.

Response   *Response Status* **C**

REJECT.

See comment response #180 D2.0 Slides 4 and 5 of the following presentation were reviewed by the task force:
https://www.ieee802.org/3/ck/public/adhoc/apr28_21/dawe_3ck_adhoc_01_042821.pdf

Slide 3 of the following presentation was reviewed by the task force:
https://www.ieee802.org/3/ck/public/21_05/diminico_3ck_04b_0521.pdf

The IL pcb min and max are derived on the basis of PCB material IL and via IL . The PCB IL assumed is 1.24 dB/in and via of 0.68 dB @26.56 GHz. With consideration for maintaining reasonable minimum length while allowing loss between TX and connector. Ilpcb(min)=(0.76 in*1.24 dB/in)+(2*0.68) dB = ~ 2.3 dB.

Reducing the insertion loss could cause reflections that may adversely affect system performance.

The comment does not provide sufficient justification for the proposed changes and specific alternate specification was not provided.

Brown, Matt   Huawei

Comment Type **T**   *Comment Status* **R**   *transition time*

Measurement method for transition times is never specified. I assume it is the same as for PMD specifications per 120E.3.1.5. To be consistent with other clauses and annexes should be "transition time" not "rise and fall timers". Given explicit methodology in 120E.3.1.5 and to be common with other clauses can delete "20% to 80%" since this is helpful but not complete.

SuggestedRemedy

With editorial license specify that the transition time is measured according to 120E.3.1.5. Throughout 162B, change "20% to 80% rise and fall times" to "transition time".

Response   *Response Status* **C**

REJECT.

The parameter names should not be changed as they relate to specific parameters in a referenced calculation.

Dudek, Mike   Marvell

Comment Type **TR**   *Comment Status* **A**   TX residual ISI

In dudek_3ck_01_0521 it was shown that with larger values of Cp it is possible to have transmitters that pass all the transmitter specifications but only provide 1.5dB COM on channels that pass the channel specifications. This was confirmed in li_3ck_adhoc_01_063021. In Li_3ck_adhoc_01_063021 it was also shown that a tightening of ERL specifications to fail these bad transmitters would also fail transmitters with varying values of Rd and other paramters that give 3.0dB COM on these same channels. Another Tx parameter is needed to fail the high Cp Tx's while still passing the Tx's with variable Rd.   A presentation will be made in support of this comment.

SuggestedRemedy

Add an extra Tx specification "Residual ISI (max) value 0.027". Defined as the value of Sigma_e/Vpeak where sigma_e and Vpeak are as defined in 162.9.3.3 except that Np=11 is used instead of Np=29.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Brown, Matt   Huawei

Comment Type **E**   *Comment Status* **A**   *transition time*

Transition time is presumably per the method in 120E.3.1.5 for all instances in this subclause. Also, given that transition time is fully defined in 120E.3.1.5 and the common term used in the draft is simply "transition time", "20% to 80% transition time" should be "transition time".

SuggestedRemedy

On page 204 line 39, change "transition time" (first instance) to "transition time (see 120E.3.1.5)".
On page 204 line 45 change "20% to 80% transition time" to "transition time (see 120E.3.1.5)".
Consider adding text in one place specifying that transition time is per 120E.3.1.5 so this does not have to be repeated multiple times.

Dudek, Mike   Marvell

Comment Type **TR**   *Comment Status* **A**   *transition time*

The filtered Ht(f) should be using the transition time of the signal generator, however the measured transition time might be interpreted as measured with the 40GHz 3dB bandwidth used for all Tx measurements. Also nothing is stated as to how the signal is measured at the transmitter output and what the Tx FFE is set to.

SuggestedRemedy

Change "where Tr is the same as the measured 20% to 80% transition time of the signal at the transmitter output" to "where Tr is the same as the measured transition time of the signal at the transmitter output corrected for the measurement bandwidth. The transition time is measured using the method in 120E.3.1.5 with a 40GHz 3dB bandwidth and the risetime is corrected to remove the effect of this measurement bandwidth.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Implement the following with editorial license:

In the first sub-bullet on item e, insert: "Tr is determined at the die bump and defined according to the method in 120G.3.1.4 except there is no observation filter."

In the second sub-bullet on item e replace:
"where Tr is the same as the measured 20% to 80% transition time of the signal at the transmitter output."
with
"where Tr is the transmitter transition time, which is measured using the method in 120G.3.1.4 and adjusted to remove the effect of the observation filter."

In the third sub-bullet on item e replace:
"is equal to the transmitter transition time measured at TP0v using the method in 120E.3.1.5 with the transmitter equalizer turned off."
with
"is the transmitter transition time measured at TP0v with the transmitter equalizer turned off, using the method in 120G.3.1.4 and adjusted to remove the effect of the observation filter."

Dudek, Mike   Marvell

Comment Type **TR**   *Comment Status* **A**   *transition time*

The method of measuring the transition time in 120E.3.1.5 uses a 33GHz measurement filter in the measurement which isn't appropriate for 100G PAM4 however bullet k states that the 40GHz 3dB bandwidth is used. The method in 163A.3.1.3 does not have any measurement filter. These need to be the same.

SuggestedRemedy

Change "is equal to the transmitter transition time measured at TP0v using the method in 120E.3.1.5 with the transmitter equalizer turned off." to "is equal to the transmitter transition time measured at TP0v with the transmitter equalizer turned off. The transition time is measured using the method in 120E.3.1.5 with a 40GHz 3dB bandwidth and the risetime is corrected to revmoe the effect of this measurement bandwidth.

Ran, Adee   Cisco systems

Comment Type **TR** *Comment Status* **A**   *pulse response*

"Obtain the output pulse response, h(t), using Equation (93A–23) and Equation (93A–24) with H(0)(f) from Equation (163A–2), where At and Tb are specified by the clause that invokes this method"

Clause 163 and annex 120F which invoke this method do not specify At and Tb - the invoking text refers to the COM tables, which include the parameters Av and fb instead. The reader may be left wondering what At and Tb are.

This can be remedied by pointing to 93A.1.5 instead of equations (93A–23) and (93A–24). 93A.1.5 includes the equations and the definition of Tb based on fb, and At is defined as Av.

Also applies to 163A.3.1.3, P308 L23.

SuggestedRemedy

Change the quoted sentence to:

"Obtain the output pulse response, h(t), as defined in 93A.1.5, with H(0)(f) from Equation (163A–2), where Av and fb are specified by the clause that invokes this method."

Apply also in 163A.3.1.3.

Comment Type **TR**   *Comment Status* **A**   *vpeak/vf*

This subclause points to 162.9.3.1.2 for the definition of v_f and to 162.9.3.1.1 for the procedure, but 162.9.3.1.2 does not define the method, it refers to 136.9.3.1.2 with exception parameters, and adds normative requirements which are irrelevant for 163A. The fact that v_f and v_peak are defined with PRESET0 is unclear (it is only part of the irrelevant normative statements) and the fact that measurements are at TP0v is not mentioned at all.

In addition, while v_peak definition refers to 162.9.3.1.1 (which itself refers to 85.8.3.3.4 and 85.8.3.3.5), the definition of v_f refers to 136.9.3.1.2 which then refers to 85.8.3.3 step 3, which does not point to the actual procedure (which is in 85.8.3.3.5). These are parallel and long paths of references with exceptions, which are very unfriendly to the reader.

Also, "Measure the transmitter output steady-state voltage… and the linear fit pulse response peak voltage..." is phrased as a test procedure. But this should be just a definition of the difference parameter.

The suggested remedy is a rewrite for clarity and for clarification that preset 0 is used and the measurement is at TP0v.

SuggestedRemedy

Change the first paragraph to the following:

The measured linear fit pulse peak v_peak(meas) and steady-state voltage v_f(meas) are calculated from a linear fit pulse response p(k) obtained from measurement at TP0v with the transmit equalizer set to preset 1 (no equalization) using the method defined in 162.9.3.1.1.

v_peak(meas) is the peak value of p(k). v_f(meas) is defined by equation (163A-x).

$\Sigma\{i=1\}\{M \times Nv\}\ p(i)/M$
Where p(i) and M are defined in 162.9.3.1.1 and Nv is 200.
