Outline

- Background – EVEC spec motivation
- Channels and COM settings for analysis
- Modified VEC mask & TP1a to whole link correlation
- Proposed changes to D1p0 for EVEC
- TP1a test methodology – filter for DFE
- Proposed changes to D1p0 for TP1a spec
- Summary

TP1a EVEC Spec – Background

- The followings proposed the ideas of combining VEC & VEO specs, which is EVEC (Effective Vertical Eye Closure)
 - ghiasi 3ck 02a 0919, sun 3ck 01b 1119, wu 3ck 01a 1119
- However, the parameters for EVEC calculation & EVEC thresholds are different among contributions

Contribution		<u>ghiasi 3ck 02a 0919</u> [1]	<u>sun 3ck 01b 1119</u> [2]	<u>wu 3ck 01a 1119</u> [3]	<u>wu_3ck_02_0120</u> [4]	<u>dudek_3ck_01_0120</u> [5]
Parameter (min/max), Unit	Symbol	Value	Value	Value	Value	Value
ESMW (Eye symmetry mask width), UI	ESMW	N/A	TBD	N/A	TBD	N/A
Eye height, differential (min), mV	EH	N/A	15	N/A	15	N/A
Vertical eye closure (max), dB	VEC	N/A	N/A	N/A	N/A	7.5
EVEC parameters						
- VEC0 (dB) = EVEC_th, max (dB)		9.5	8.5	6.5	7	7.5
- VEC1 (dB)		12.5	11	11.5	10.5	7.5
- VEO0 (dB)		10	15	10	12.5	10
- VEO1 (dB)		20	30	25	25	10

- The purpose of this contribution
 - To propose parameters used for EVEC calculation & the EVEC threshold accordingly

Channel and Analysis

- Channel and reference receiver
 - Whole-link & TP1a analysis for 66 IEEE C2M host-to-module channels
 - Sweep host package trace length, $z_{p1}(TX)$
 - $z_{p1}(TX) = [7:0.5:10 \ 11:14 \ 15:5:40]$, from 7 to 40 mm covering wide range
 - total $66 * 17 = 4686$ CH+PKG test cases
 - Ref RX = 4-tap DFE as 802.3ck D1p0
- COM parameter settings [details in appendix]
 - COM 2.76
 - Whole link: TX PKG + H2M Channels + RX PKG
 - Table 1
 - $g_{DC} = [-14:1:-3]$ dB
 - $g_{DC_HP} = [-3:1:0]$ dB
 - $b_{max}(1) = 0.5$, $b_{max}(2..N_b) = 0.2$
 - TP1a: TX PKG + H2M Channels
 - Set 'zero' to related RX PKG & on-die settings

Table 1

Spec	[Host, Module]	Unit
C_d	[1.2e-4 0.85e-4]	nF
L_s	[0.12 0.12]	nH
C_b	[0.3e-4 0.3e-4]	nF
R_d	[50 50]	Ohm
C_p	[0.87 0.65]	nF
z_p(RX)	[5 0]	Ohm

EVEC Parameters

$$EVEC(i) = \begin{cases} VEC(i), & \text{if } VEO(i) < VEO_0 \\ VEC(i) - (VEC_1 - VEC_0) / (VEO_1 - VEO_0) \times (VEO(i) - VEO_0), & \text{if } VEO_0 \leq VEO(i) < VEO_1 \\ VEC(i) - (VEC_1 - VEC_0), & \text{otherwise} \end{cases}$$

- We swept all the possible values of VEC_0 , VEC_1 , VEO_0 and VEO_1
 - Set the following optimal values by searching maximum of the correlation coefficients between the whole-link COM and EVEC
 - The EVEC parameters achieving best correlation are

Parameters	Values
VEC_0	7.0
VEC_1	10.5
VEO_0	12.5
VEO_1	25.0

EVEC Mask Threshold

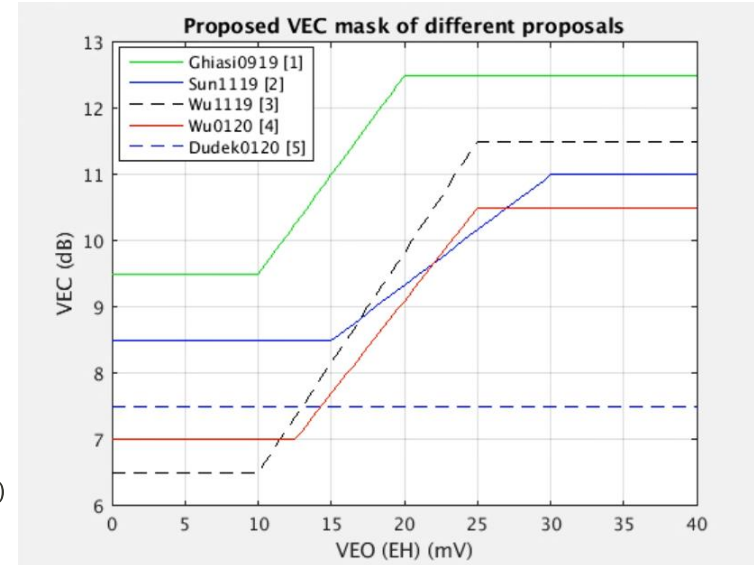

1. Fix TX EQ by TP1a
2. $N_b=4$
3. Set $\text{Eta}_0 = 8.2e-9$ (SysNs + 0.0mV RxNs)

- EVEC Threshold = 7
- % of false fail = 5.6%
- % of false pass = 3.4%
- % of false cases = 9.0%
- Correlation coefficient = -0.822

Several EVEC Mask – Comparison

- $$EVEC1 = \begin{cases} VEC, & \text{if } VEO < 10 \text{ mV} \\ VEC - 0.3 \times (VEO - 10), & \text{if } 10 \text{ mV} \leq VEO < 20 \text{ mV} \\ VEC - 3, & \text{otherwise} \end{cases} \quad (\text{Ghiasi0919 [1]})$$
- $$EVEC2 = \begin{cases} VEC, & \text{if } VEO < 15 \text{ mV} \\ VEC - 0.1667 \times (VEO - 15), & \text{if } 15 \text{ mV} \leq VEO < 30 \text{ mV} \\ VEC - 2.5, & \text{otherwise} \end{cases} \quad (\text{Sun1119 [2]})$$
- $$EVEC3 = \begin{cases} VEC, & \text{if } VEO < 10 \text{ mV} \\ VEC - 0.3333 \times (VEO - 10), & \text{if } 10 \text{ mV} \leq VEO < 25 \text{ mV} \\ VEC - 5, & \text{otherwise} \end{cases} \quad (\text{Wu1119 [3]})$$
- $$EVEC4 = \begin{cases} VEC, & \text{if } VEO < 12.5 \text{ mV} \\ VEC - 0.28 \times (VEO - 12.5), & \text{if } 12.5 \text{ mV} \leq VEO < 25 \text{ mV} \\ VEC - 3.5, & \text{otherwise} \end{cases} \quad (\text{Wu0120 [4]})$$

- We observe the absolute value of correlation coefficients between the whole-link COM and EVEC for the above 4 different EVEC parameter settings in the following page

 - Analysis of total 9 cases with
 - Different DFE taps: 4 ~ 6
 - Different Eta_0: 0.82e-8, 3.33e-8, 10.9e-8

Case	Eta_0 (V ² /GHz)	N_b
4TEta1	8.20E-09	4
5TEta1	8.20E-09	5
6TEta1	8.20E-09	6
4TEta2	3.33E-08	4
5TEta2	3.33E-08	5
6TEta2	3.33E-08	6
4TEta3	1.09E-07	4
5TEta3	1.09E-07	5
6TEta3	1.09E-07	6

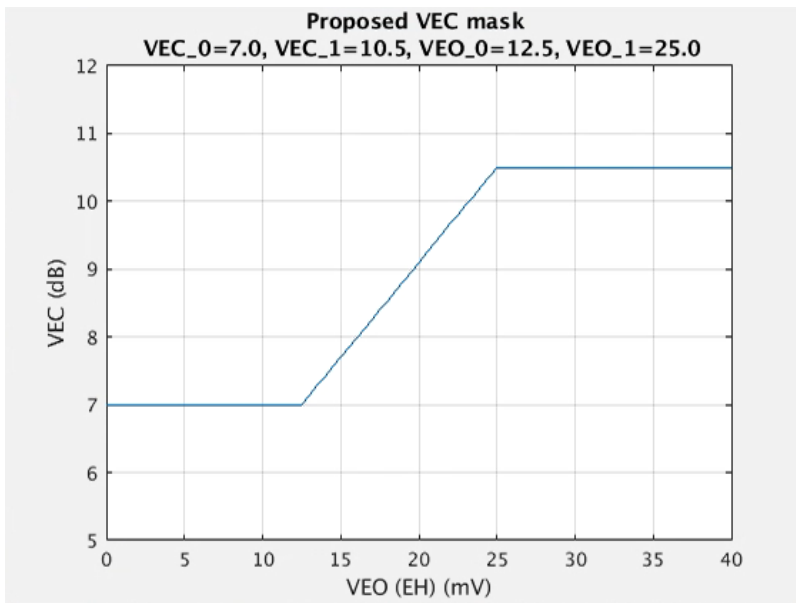

Abs. of correlation coefficient – Comparison

Case	Eta_0 (V ² /GHz)	N_b	abs(correlation coefficient)				
			ghiasi_3ck_02a_0919 [1]	sun_3ck_01b_1_119 [2]	wu_3ck_01a_1_119 [3]	wu_3ck_02_01_20 [4]	dudek_3ck_01_0120 [5]
4TEta1	8.20E-09	4	0.893	0.836	0.786	0.822	0.907
5TEta1	8.20E-09	5	0.858	0.827	0.801	0.827	0.834
6TEta1	8.20E-09	6	0.863	0.824	0.801	0.827	0.835
4TEta2	3.33E-08	4	0.906	0.887	0.864	0.887	0.863
5TEta2	3.33E-08	5	0.846	0.858	0.862	0.872	0.765
6TEta2	3.33E-08	6	0.850	0.855	0.862	0.872	0.763
4TEta3	1.09E-07	4	0.763	0.856	0.904	0.887	0.585
5TEta3	1.09E-07	5	0.651	0.773	0.842	0.814	0.447
6TEta3	1.09E-07	6	0.650	0.767	0.840	0.811	0.440
	Average		0.809	0.831	0.840	0.847	0.715

- EVEC in [2], [3], [4] has similar results in ‘average’ correlation coefficients
 - [4] has all values > 0.8, while others have some cases slightly smaller than 0.8
- For ‘large Eta_0’ case, [1] & [5] performed bad, with values < 0.7
 - For VEC, the values are even < 0.5 if DFE taps > 4-tap

Proposed EVEC Mask

- $$EVEC = \begin{cases} VEC, & \text{if } VEO < 12.5 \text{ mV} \\ VEC - 0.28 \times (VEO - 12.5), & \text{if } 12.5 \text{ mV} \leq VEO < 25 \text{ mV} \\ VEC - 3.5, & \text{otherwise} \end{cases} \quad (120G - 4)$$

- Insert the following paragraph in 120G.4.2 after Line 31 at Page 226
- h) Compute the effective vertical eye closure (EVEC) by Equation (120G-4)
- Change the parameter of “Vertical eye closure (max)” in Table 120G-1 at page 213 as below

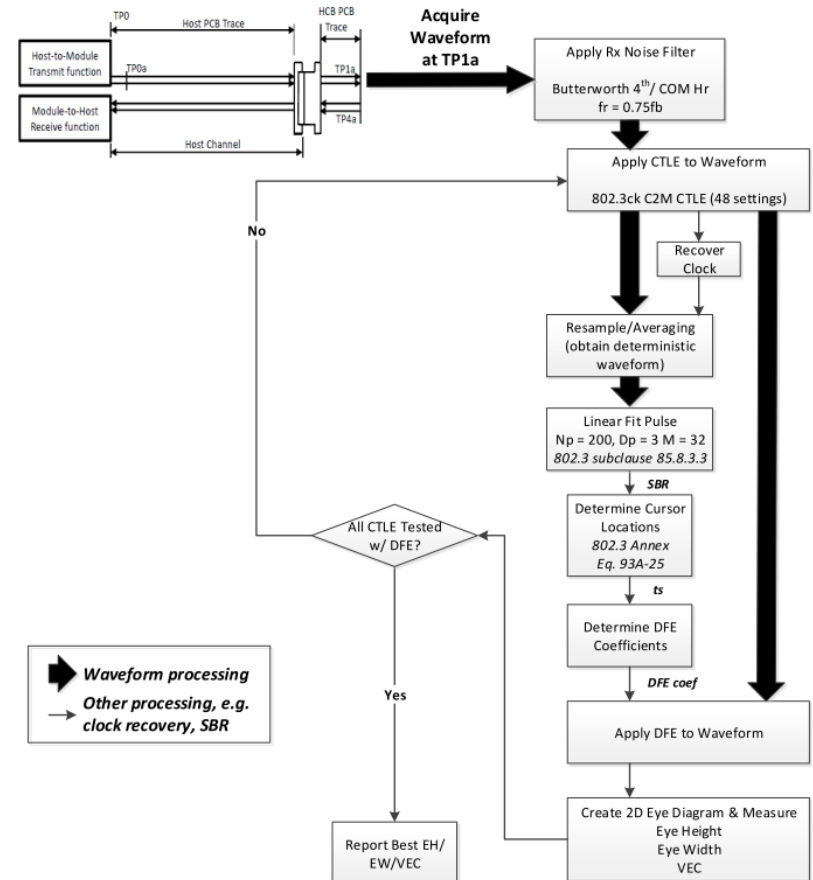

Parameter	Reference	Value	Units
Effective vertical eye closure (max)	120G.4.2	7.0	dB

C2M TP1a specs change proposal

- Criterion: EVEC ≤ 7.0
- Propose to change D1p0 as below
- Original: 120G.4.2, Line 33 @ Page 226
 - Within the set of combinations of gDC and $gDC2$ with eye height meeting the target requirement, for the combination resulting in the smallest vertical eye closure, the eye height, eye width, and vertical eye closure are used as the measured values.
- Proposal
 - Within the set of combinations of gDC and $gDC2$, the eye height, eye width, and **effective vertical eye closure**, resulting in the smallest **effective vertical eye closure**, are used as the measured values.

TP1a test methodology in D1p0

- TP1a test methodologies had been proposed & adopted in sun 3ck 01b 1119 & sun 3ck 02 1119
 - Detailed implementation can be found in li 3ck 02 1119
- One question remained
 - By “Applying DFE to Waveform”, shall we apply any kind of filters to DFE coefficient?
 - Filter for DFE coefficient matters → have impacts to measured Eye Width, VEC, ...
 - We need to make it clear in 802.3ck

Recap – Feedback decision in D1p0

Perform the following five steps for each valid combination of g_{DC} and g_{DC2} as specified in Table 120G–9:

- c) Compute the response $y_2(k)$ by applying the effect of the continuous time filter to $y_1(k)$ using the associated parameters in Table 120G–9.
- d) Compute the linear fit pulse response of $p_2(k)$ using the method defined in 136.9.3.1.1 with parameter M the same as for step a), D_p equal to 3, and N_p equal to 200.
- e) Compute the DFE sampling phase t_s and tap weights $b(n)$ for $p_2(k)$ according to the methodology in 93A.1.6 using the associated parameters in Table 120G–9.
- f) Compute receiver input signal $y_{rx}(k)$ by applying the effect of the DFE using the sampling phase t_s and tap weights $b(n)$ determined in the previous step.
- g) Compute an eye diagram from $y_{rx}(k)$ and compute the eye height, eye width, and vertical eye closure from the eye diagram using the methodologies in 120E.4.2 and 120E.4.3.

Copied from 93A.1.6

- f) e) Compute $h_{ISI}(n)$ per Equation (93A–27). This represents the residual intersymbol interference (ISI) after decision feedback equalization. The computed per Equation (93A–31) and Equation (93A

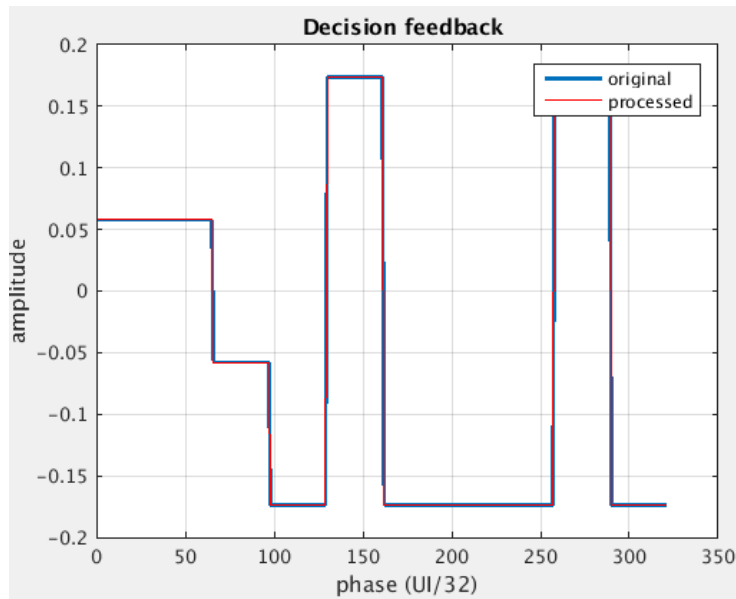

$$h_{ISI}(n) = \begin{cases} 0 & n = 0 \\ h^{(0)}(t_s + nT_b) - h^{(0)}(t_s)b(n) & 1 \leq n \leq N_f \\ h^{(0)}(t_s + nT_b) & \text{otherwise} \end{cases}$$

- Based on the above description in 93A.1.6
 - It seems ‘Constant DFE coefficient’ in single UI is adopted → is that true?
 - What if ‘Gaussian filter’ is applied for DFE coefficient?

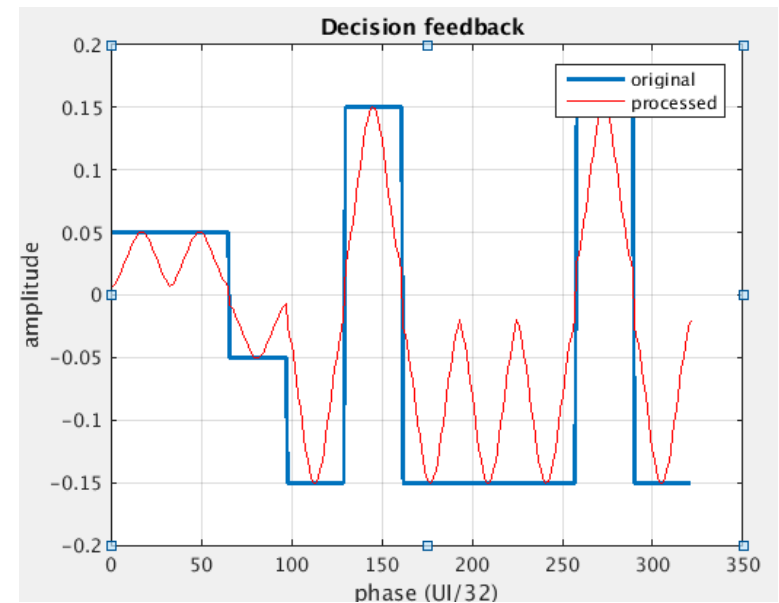

Filter for DFE – Constant vs. Gaussian

- We analyzed two cases of filter to DFE coefficients
 - Constant – DFE values keeps the same for the entire UI
 - Gaussian – Smooth the waveform of DFE values

Constant – no filters at all

Gaussian filter

Filter for DFE – Constant vs. Gaussian

Constant – no filters at all

Gaussian filter

- Channel
 - Jane Lim's ch5b_3" with TX 16+1.8mm
- Filter applies to DFE matters
- In order to avoid defining detailed specs of Gaussian filter, we propose to adopt 'Constant'

	Constant	Gaussian
TC_{mid}	14.5	15.5
EH5 (mV)	[69.7 59.0 69.8]	[50.6 50.5 67.5]
EW5 (mUI)	[51 103 36]	[21 23 4]
VEC5 (dB)	[3.2 4.6 3.2]	[6.9 6.9 4.4]

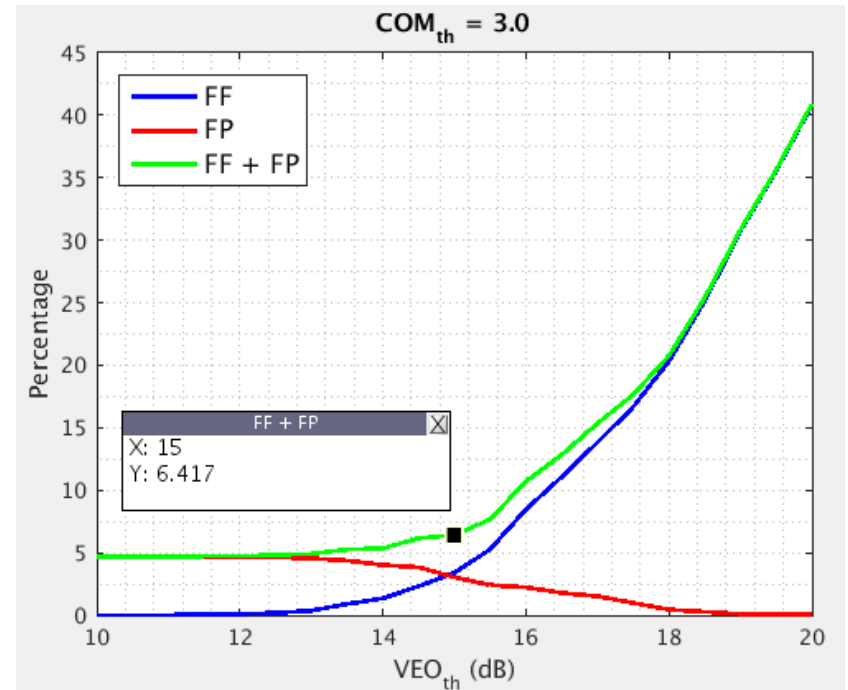

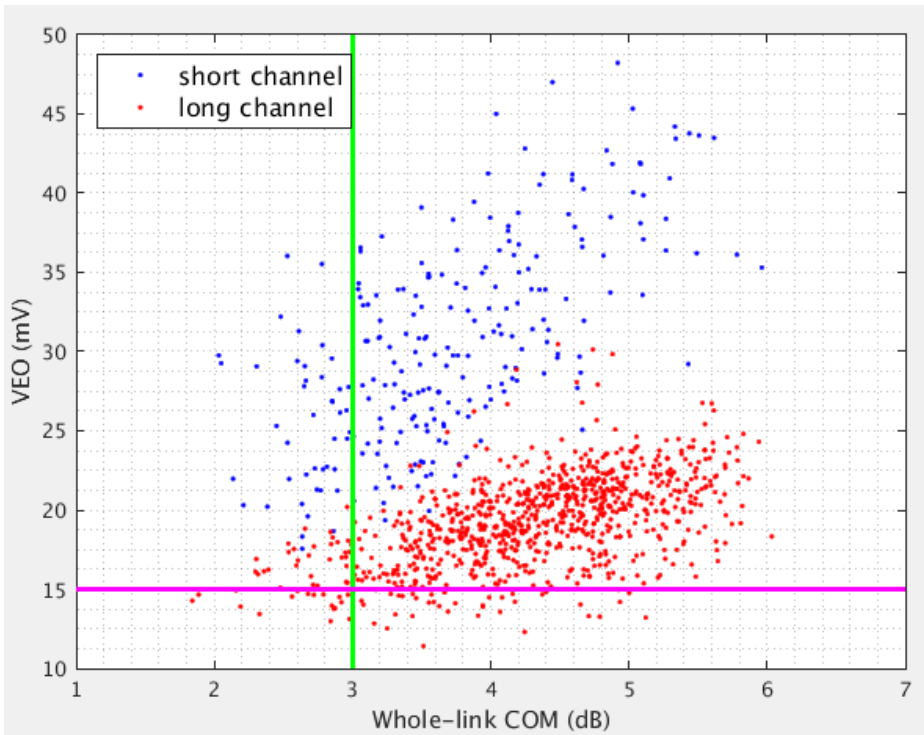

Proposed Change to D1p0 –test methodology

- Original – 120G.4.2 Eye opening measurement method, step f) [Page 226, L28]
 - Compute receiver input signal $y_{rx}(k)$ by applying the effect of the DFE using the sampling phase t_s and tap weights $b(n)$ determined in the previous step.
- Proposal – Insert the following sentence after the original sentence
 - The effect of DFE changes value to $b(n)$ at the time of $t_s + \text{half UI}$ and keeps the same value for the following entire UI.

Analysis of 66 C2M Channels – VEO_{min}

1. Fix TX EQ by TP1a
2. $N_b=4$
3. Set $\text{Eta}_0 = 8.2e-9$ (SysNs + 0.0mV RxNs)

- VEO (EH) Threshold = **15 mV**
- % of false cases = 6.4%

Proposed TP1a Spec

- Spec in D1p0 [Page 213]

Table 120G-1—Host output characteristics at TP1a

Parameter	Reference	Value	Units
ESMW (eye symmetry mask width)	120E.4.2	TBD	UI
Eye height, differential (min)	120E.4.2	TBD	mV
Vertical eye closure (max)	120E.4.2	TBD	dB

- Propose to **change** to

Parameter	Reference	Value	Units
ESMW (eye symmetry mask width)	120E.4.2	TBD	UI
Eye height, differential (min)	120E.4.2	15	mV
Effective vertical eye closure (max)	120G.4.2	7.0	dB

Summary

- Based on nearly 5000 analysis case, we set optimal EVEC parameters & threshold to achieve
 - High correlation coefficient: -0.82
 - Low total false ratio: 9%
- Propose to “no filters” for DFE & make it clear
- Came out EH spec by nearly 5000 analysis case
 - Propose $EH_{\min} = 15\text{mV}$
- Propose to adopt the following slides to change D1p0
 - Slide 11, 12, 17, & 19
