It appears to me that this project is likely to get to RevCom before P802.3cw (D2.0 being the current draft). I don't find any order dependency between P802.3cw/D2.0 and P802.3cy/D3.0.

SuggestedRemedy

If Mr. Law concurs: 1. renumber to Amendment 8, 2. remove cw from list at line 28 (note that cw is not in proper order now), 3. remove cw description on page 12 and renumber cy to amendment 8.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

1. renumbered to Amendment 8,
2. removed cw from list at line 28 (note that cw is not in proper order now),
3. removed cw description on page 12 and renumber cy to amendment 8.

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **A**

"If bits 1.2311.12:11 are set to these undefined values, the PHY will communicate these values to the link partner"

The term "undefined" (and sometimes "not defined") seems incorrect here - the values are defined, but are invalid in some cases. All the other text in 45.2.1 seems to use the word "invalid" for values that are not allowed.

Also, "will" is deprecated and should only used in statements of fact. In this case, since the value is invalid ("undefined"), saying that the PHY will communicate is likely not a requirement but rather allowed behavior, so "may" is preferable.

Also, it is not stated how a receiver that receives an invalid value and does not support it is expected to behave. To prevent such a receiver from "taking the blame", the behavior should be stated as "undefined".

SuggestedRemedy

Change all instances of "undefined" and "not defined" in 45.2.1.244.1 and 45.2.1.245.1, and in Table 45-206 and Table 45-207, to "invalid".

Change "will" to "may" in 45.2.1.244.1. Change "will indicate" to "indicates" in 45.2.1.245.1.

Append the following sentence to the end of the second paragraph of 45.2.1.244.1 and the second paragraph of 45.2.1.245.1: "The behavior of a receiver that receives an invalid interleave request is undefined".

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.

Change all instances of "undefined" in 45.2.1.244.1 and 45.2.1.245.1, and in Table 45-206 and Table 45-207, to "not defined".

Change "PHY will communicate these values" to "PHY communicates these values" in 45.2.1.244.1. Change "will indicate" to "indicates" in 45.2.1.245.1.

The use of the word "invalid" changes the meaning for the existing Clause 149 PHY and indicates a new error condition which was not intended.

Zimmerman, George Cisco Systems, Inc.,CME Consulting,CommScope,M

Comment Type **TR** *Comment Status* **A**

The rfer_timer does not appear in the RFER Monitor State Diagram (Fig 149-15 or Figure 165-13), hence it does not appear to control the high_rfer state. While the variable definition says within one rfer_timer interval, this is in disagreement with the state diagram, which never starts (or resets) rfer_timer appears to count RFRX_CNT_LIMIT RS-FEC frames. RFRX_CNT_LIMIT is a constant set to 88 frames. This equates to 281 600 bit times in clause 149, and 732 160 bit times in clause 165. Note the error rate is still 16 blocks out of 88 blocks received according to the state diagram, which would be high anyways. (note - this appears to be an error in the base standard and the change would correct a double/inconsistent requirement in clause 149)

SuggestedRemedy

P28 L10 & 11 (2 occurences): Change "within one rfer_timer interval" to "within 88 RS-FEC frames"
Add 149.3.7.2.2 to the draft, changing the definition of hi_rfer from "Boolean variable that is asserted TRUE when the rfer_cnt reaches 16 errors in one rfer_timer
interval." to "Boolean variable that is asserted TRUE when the rfer_cnt reaches 16 errors in one RFRX_CNT_LIMIT interval."
Delete definition of rfer_timer at 165.3.7.2.3 (P67 L35 to 38).

"25GBASE-T1 represents… and baseband medium, for data communication at 25Gb/s over a point-to-point single balanced pair of conductors… for transmission on a single balanced pair of conductors"

This text is unnecessarily wordy.

25GBASE-T1 does not "use a baseband medium for data communication over a point-to-point single balanced pair of conductors"; the point-to-point single balanced pair of conductors is the baseband medium.

It is sufficient to mention "single balanced pair of conductors" once.

SuggestedRemedy

Change the text of the new paragraph to read:
"25GBASE-T1 represents Physical Layer devices using Clause 165 Physical Coding Sublayer (PCS) and Physical Medium Attachment (PMA) sublayer, for data communication at 25Gb/s over a point-to-point single balanced pair of conductors. 25GBASE-T1 uses Reed-Solomon FEC and PAM4 modulation".

This is an unnecessarily restrictive and fancy way of determining the delay, subject to errors and misunderstanding. Also, delay is dependant on frequency, you might consider determining it at each frequency point, instead of applying this estimate of the delay reguardless of frequency.

SuggestedRemedy

replace lines 36-50 with 'Determine the delay by any convenient method'

Response *Response Status* **C**

REJECT.

The equation may look complicated partly because of its less than desirable formatting and it is a simple linear fit to the phase. It is one of the widely used methods to estimate the delay. This delay represents the length of the cable.
No changes to the draft needed.

It is illogical and dangerous to throw away the part of the tail that is past the round trip delay. A short link with low IL cable, and highly reflective connectors, might have secondary reflections that might be harmful, which this ignores.

SuggestedRemedy

Delete the 3rd row of equation 165-34 and apply the second row for all m < n. An alternative would be, increase L(sub-e) to twice the RT delay, or to 1.2 times the RT delay. There are other alternatives.

Proposed Response *Response Status* **Z**

REJECT.

"Figure 165–27—Transmitter test configuration 4 for power spectral density measurementand transmit power level measurement"
There are only 3 test configurations defined in this subclause. The label for this configuration should be '3'.

SuggestedRemedy

change 'configuration 4' to 'configuration 3' and associated references, ie. page 95 line 52

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The same comment disposition detail as in comment #i-4, i.e.,

Removed Figure 165-27 and reference Figure 165-25 for PSD mask test.

Changed Figure 165-25 description from.
“Transmitter test configuration 1 for transmitter droop, transmitter linearity, and jitter measurement”
To,
“Transmitter test configuration 1 for transmitter droop, transmitter linearity, jitter and power spectral density measurement, and transmit power level measurements”

Changed references concerning Figure 165-27 as follows.
• Removed wording in line 18 page 92 “Figure 165-27”.
• Removed Figure 165-27 on page 93.
• Changed “165-27” on page 95 line 53 to “165-25”.

Also on P95L52 changed "configuration 4" to "configuration 1".

Larsen, Wayne CommScope

Comment Type **T** *Comment Status* **R**

This document specifies a particular way of obtaining a time response, then a numerical acceptance criteria based on it. It is usual to specify acceptance based on the physical phenomenon, not based on a particular way of measuring it. Also, it would benefit from a graphical illustration of the acceptance criteria like figure 165-35.

SuggestedRemedy

In 165.7.1.3.5, describe the return loss in energy returned per time interval, and the associated limits. Provide a graphical illustration. The present text can be retained as an example of determining compliance.

Response *Response Status* **C**

REJECT.

The proposed change in the comment does not contain sufficient detail so that the task group can understand the specific changes being suggested by the commenter.

Comment Type **TR** *Comment Status* **A**

The term "out of band" is defined in 1.4.442 as "using a frequency that is within the pass band
of the transmission facility but outside a frequency range normally used for data transmission".

The OAM signaling does not match this definition; on the contrary, it is in-band, per the definition in 1.4.359: "within the bandwidth of the information channel".

There are several instances of this incorrect use of "out of band" in the base standard, which should be dealt with through maintenance; but a new clause should be correct.

(See comment R1-9 against P802.3cz D3.1)

SuggestedRemedy

Change "The OAM for 25GBASE-T1 information is exchanged between two 25GBASE-T1 PHYs out of band, that is, outside of the specified 25 Gb/s Ethernet data stream" to "The OAM for 25GBASE-T1 information is exchanged between two 25GBASE-T1 PHYs in-band, by interleaving it with the 25 GB/s Ethernet data stream".

Alternatively, delete the sentence to avoid the "band" terms.

Response *Response Status* **W**

Ran, Adee Cisco Systems, Inc.

Comment Type **E** *Comment Status* **A**

The terms "RS-FEC frame", "superframe", "training frames", "PHY frame", "framing", in addition to the usual meaning of "frame" as a MAC frame (see 1.4.385); "frame" is often used with not qualifier, leaving it to the reader to understand it from the context.

This loose terminology is unfortunate. Although it originates from earlier projects, there are efforts to use the term "codeword" for RS-FEC blocks (which is quite established and unambiguous), and it may come up in maintenance at some point. Better do it well in each new project...

For completeness consider the following terminology replacements:
Frame (referring to RS-FEC) -> codeword
"Superframe" -> codeword group
"Training frame" - retain (used in several other places) but only as a qualified term
"Framing" -> alignment (in the receive direction), "encoding" (in the transmit direction).

SuggestedRemedy

Change to the terminology described in the comment, with editorial license.

If this is not done, ensure that all instances of "frame" that do not refer to MAC frames are fully qualified.

"...the PCS Transmit function shall use a 65B coding technique to generate code-groups that represent data or control"

"code-groups" is inadequate here; it seems to originate from existing BASE-T PHYs. The 65B blocks represent data and control characters, but there are additional processing steps (FEC, OAM) before the data is converted to PAM4 symbols (corresponding to code-groups in other BASE-T PHYs).

The suggested remedy is a possible replacement text; other changes may be possible, but the term "code-group" should not be used.

SuggestedRemedy

Change the quoted sentence to
"the PCS Transmit function shall use the transmit process specified in 165.3.2.2.13 through 165.3.2.2.21 to generate the data stream and PAM4 symbol stream, as illustrated in Figure 165-5."

Change the PICS item accordingly.

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.

Change: “the PCS Transmit function shall use a 65B coding technique to generate code-groups that represent data or control.”

To “the PCS Transmit function shall use the 65B coding technique specified in 149.3.2.2.4 to represent data or control.”

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **A**

In Figure 165-5, the "circled large plus sign" seems to denote a bitwise XOR operation (or modulo 2 addition), but it is not stated explicitly. Compare to Figure 165-9 which has a legend for its operations.

Figure 165-6 and Figure 165-7 also use similar, but different, "plus sign in a circle".

The same symbol is also used in Equation 165-4 without explicit definition.

Note that the established convention for XOR is a gate symbol, and in text the caret character (^, see Table 21-1).

SuggestedRemedy

Add a legend explaining the "circled plus sign" in the figures.

Change to the "^" symbol in Equation 165-4 and add "where ^ denotes the XOR operation".

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.

Add a legend explaining the "circled plus sign" in 165.1.6.

Cl **165** *SC* **165.3.2.2.2** *P* **53** *L* # I-121

Ran, Adee Cisco Systems, Inc.

Comment Type **E** *Comment Status* **R**

Incorrect hierarchy; the subclause heading "65B RS-FEC transmission code" addresses all the content in the subsequent subclauses, 165.3.2.2.3 through 165.3.2.2.17, most of which are details of "Use of blocks".

The hierarchy is unnecessarily deep, and can be flattened; 165.3 and 165.3.2 have practically the same title.

SuggestedRemedy

Move 163.3.2.2.3 through 163.3.2.2.17 to be below the current 163.3.2.2.2.

Flatten the hierarchy by removing the subclause 165.3.2 ("PCS functions") and promoting its three subclauses upwards to the parent subclause 165.3 ("Physical Coding Sublayer (PCS) functions")

Response *Response Status* **C**

REJECT.

The Task Force believes matching the structure of Clause 165 with the previous BASE-T1 clauses is beneficial. No changes to the draft needed.

Comment Type **E** *Comment Status* **A** *EZ*

The first sentence of this subclause states that "the symbol size is 10 bits".
The next sentences have three instances of "ten-bit" as an adjective of the symbol, after the number of symbols.

The initial sentence is sufficient, and there is no need to write "ten-bit" every time a symbol is mentioned; combined with the number of symbols, this does not contribute to readability.

SuggestedRemedy

Delete "ten-bit" before "RS-FEC" three times in this paragraph.

Response *Response Status* **C**

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **A**

"Equation (165–2) defines the message polynomial m(x)"
m(x) is not one specific polynomial, and it cannot be defined as such. It is a representation of the data.

"Equation (165–3) defines the parity polynomial p(x) whose coefficients are the parity symbols p21 to p0"
Similarly, the parity polynomial is not defined by this equation, but by the calculation of the remainder of division of m(x) by g(x), as indicated in the subsequent text.

Also, the encoder illustrated in Figure 165-9 is not just a shift register.

(See comment R1-22 against P802.3cz D3.1)

SuggestedRemedy

Change the quoted sentences to, respectively,

"The contents of the RS-FEC message are represented by a polynomial m(x) whose coefficients are the message symbols m521 to m0 as shown in Equation (165–2)"

and

"The parity polynomial p(x) is calculated as the remainder of polynomial division of m(x) by g(x). Its coefficients p89 to p0, as shown in Equation (165–3), are the parity symbols".

Change from
"The parity polynomial is the remainder from the division of m(x) by g(x). This can be computed using the shift register implementation illustrated in Figure 165–9"
to
The calculation of the coefficients of p(x) is illustrated in Figure 165–9".

"Alert, a four RS-FEC frame long sequence (alert_length), shall start four frames after the beginning of any eighth RS-FEC frame counting from the start of the QR cycle"

This is an awkwardly phrased sentence, and the "shall" seems inadequate; this is a description of the required alignment of the alert sequence.

Also, the final sentence in this paragraph (only starting at frame 92) contradicts the beginning ("any"), adding to the confusion.

This paragraph is followed by tables which seem to say the same thing in a more formal way. Perhaps it is enough to point to the tables.

SuggestedRemedy

Change to "Alert is a sequence of length alert_length RS-FEC frames (see Table 165-3) that can start only at the beginning of RS-FEC frame u for specific values of u (where u denotes the 0-based index of the RS-FEC frame counting from the start of the QR cycle).

When slow wake is 0, the valid locations for Alert are when u mod 8 = 4. When slow wake is 1, the only valid location for Alert is u=92."

Alternatively, delete the text description and use a reference to tables 165-4 and 165-5.

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.

Changed
"Alert, a four RS-FEC frame long sequence (alert_length), shall start four frames after the beginning of any eighth RS-FEC frame counting from the start of the QR cycle. The MASTER and SLAVE shall derive the tx_refresh_active and tx_alert_start_next signals from the transmitted RS-FEC frames as shown in Table 165–4 and Table 165–5. When Slow Wake is active, alert can be transmitted in only a single QR cycle location, starting at RS-FEC frame 92."
to
"Alert is a four RS-FEC frame long sequence (alert_length). When SlowWakeRequest is set to 0, alert can be transmitted such that it ends at any eighth RS-FEC frame boundary, counting from the start of the QR cycle (see Figure 165-11). When SlowWakeRequest is set to 1, alert can only be transmitted in a single QR cycle location, starting at RS-FEC frame 92 for master and at RS-FEC frame 44 for slave (see Figure 165-12). The synchronization for the alert signaling is described in tables 165-4 and 165-5."

Cl **165** *SC* **165.3.6.1** *P* **66** *L* **21** # I-135

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **A** *AI*

"Slow Wake" is mentioned here for the first time, and does not seem to be defined anywhere. It also appears in tables 165-4 and 165-5.

After a long search I found an InfoField bit called "SlowWakeRequest" defined in 165.4.2.4.5. But there is no variable called "Slow Wake" and it is not defined that SlowWakeRequest in the PHY capability bits is sent based on some variable that has another effect.

SlowWakeRequest and "slow wake" are not the same thing, and readers should not be expected to link them.

SuggestedRemedy

At the minimum, Change "slow wake" to "SlowWakeRequest" and add "(see 165.4.2.4.5)" in some appropriate place in the text.

Preferably, add a variable definition and a more detailed explanation of the SlowWakeRequest bit and the condition for sending alerts one way or the other; I assume is it the local SlowWakeRequest rather than the remote one that controls it?

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.
•P78L39 - change "SlowWakeRequest is set to indicate to the link partner that the PHY will transmit alert only immediately following a refresh."
to
"SlowWakeRequest = 1 indicates to the link partner that the PHY will transmit alert once per QR cycle (see 165.3.6.1)"

•P65 L4 – at the end of the line add the following “The alert signal is restricted to starting at predetermined RS-FEC frame count values, where the allowed values depend on if the SlowWakeRequest PHY capability bit is set to 1.”

•P65 L21 – change “Slow Wake not active” to “SlowWakeRequest is set to 0”

•P65 L39 – change “Slow Wake active” to “SlowWakeRequest is set to 1”

•P66 L21 – change “Slow Wake is active” to “SlowWakeRequest is set to 1”

•P66 L27 – change “Slow Wake” to “SlowWakeRequest”

•P66 L27 – change “Slow Wake” to “SlowWakeRequest”

Comment Type **T** *Comment Status* **A**

This sentence says that 25GBASE-T1 makes extensive use of functions that may not be provided. So a conforming implementation makes extensive use of functions not present sometimes. Pretty sure that is not what is meant. Not sure what is meant though. Does it mean the optional functions may (or may not) be used WHEN they are provided? Is this an optional requirement, a recommendation, or a mandatory requirement to use these functions when they are available? I can only guess. Also not sure what "extensive use" would be in this context. Less than always and more than never. Hard to write a validation test for that!
Well one guess is given in the proposed change.

SuggestedRemedy

25GBASE-T1 may make use of the management functions provided by the optional MDIO (Clause 45), and the communication and self-configuration functions provided by the optional Auto-Negotiation (Clause 98), when those functions are available.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Removed "extensive" page 101, line 3

The functions are always provided, but the MDIO may not be instantiated as an interface.

Cl **165** *SC* **165.7.1.1** *P* **102** *L* **1** # I-139

Comment Type **TR** *Comment Status* **A**

Figure 165–34 does not illustrate an insertion loss - it is a limit line.

Also applies to Figure 165-35, Figure 165-36, Figure 165-37, Figure 165-38, and Figure 165-39 (different titles, but similar lack of "limit").

SuggestedRemedy

Change "The insertion loss is illustrated in Figure 165–34" to "The 25GBASE-T1 link segment insertion loss limit is illustrated in Figure 165–34".

Change the figure title to "Insertion loss calculated limit in Equation (165–19)". Add a label "meets equation constraint" above the plot in the figure.

Implement corresponding changes in the other figures listed in the comment and the text preceding them.

Jonsson, Ragnar Marvell Semiconductor, Inc.

Comment Type **E** *Comment Status* **A**

It is not clear what k value in REM(k) to use for the ETM(m)

SuggestedRemedy

Change "evaluated at Ndiscard_etm" to "evaluated at k=Ndiscard_etm"

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Replace text after "to calculate" in step 8 with "to calculate each ETM(m) using the value of g \sub n \sup m as the value of REM(k) in Equation 165-29 evaluated at k = Ndiscard_etm."

Same comment disposition detail as comment #i-50.

Cl **165** *SC* **165.7.1.3.4** *P* **106** *L* **30** # I-47

Zimmerman, George Cisco Systems, Inc.,CME Consulting,CommScope,M

Comment Type **TR** *Comment Status* **A**

The truncation of the echo response based on delay length is fundamental to the ETM and creates the potential for missing reflections due to mismatch of short segments which can extend the resulting time delay of the echo response relative to the mean-square estimated link segment delay. Additionally, delay dispersion of low frequency echo is assumed to be minimized - complicated and enabled by the 100 MHz cutoff on the measurement of IL. All of the issues noted make the ETM less useful and more problematic than it is worth, in this commenters opinion.

SuggestedRemedy

Delete 165.7.1.3.4 and 165.7.1.3.6. Change title of 165.7.1.3.2 to Residual echo metric. Delete last row of Table 165-15 (Ndiscard_etm). Delete PICS LSC4 (P128 L24)

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

Added editor's note in 165.7.1.3.4 with the following text:

"Commenters are suggested to carefully review the algorithm in 165.7.1.3.4 and 165.7.1.3.6 considering at least the error analysis and the characteristics of link segments that ETM will disqualify."

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **A** *G1*

"Transmit data delay is measured from the input of a given unit of data at the 25GMII to the presentation of the same unit of data by the PHY to the MDI. Receive data delay is measured from the input of a given unit of data at the MDI to the presentation of the same unit of data by the PHY to the 25GMII"

These delays cannot be measured separately in practice; the 25GMII is typically not exposed and the data presented at the 25GMII is not easy to identify on the MDI due to the encoding and scrambling operations.

In other PHY types, the specification is indeed for the sum of the transmit and receive data delays, but there is no separate definition; the reason is that the sum _is_ measurable easily, either internally or using test equipment, using a loopback configuration.

It may be acceptable to _define_ the delays in each direction, but not using the word "measured", because they cannot be measured separately.

SuggestedRemedy

Change "is measured" to "is defined", twice in the quoted sentences.

Response *Response Status* **W**

ACCEPT.

Cl **165** *SC* **165.10** *P* **112** *L* **44** # I-141

Ran, Adee Cisco Systems, Inc.

Comment Type **TR** *Comment Status* **R** *G2*

The delay limits specified in Table 165-16 are very large; I assume they are a result of the long RS-FEC block size with large overhead (RS-FEC(936,846)!), and the interleaving of multiple blocks, required in practice to mitigate error bursts. Therefore, it is likely that the actual delays of real implementations will not be much smaller than the specified maxima. This means the practical round-trip delay will be about 10 microseconds due to the physical layer alone. This is usually not considered attractive.

Add to that the strong receiver required for channels with insertion loss exceeding >30 dB at the fundamental frequency, with PAM4 modulation and full-duplex signaling; Has the power consumption of such receivers been assessed?

The large latency and high power, combined, raise doubts about broad market potential/technical feasibility combination for the new port type.

SuggestedRemedy

Provide an analysis of expected power.
Provide an overview of the targeted applications of 25GBASE-T1 and whether the expected power and latency are acceptable for these applications.

Response *Response Status* **W**

REJECT.

The proposed change in the comment does not contain sufficient detail so that the task group can understand the specific changes being suggested by the commenter.
