#### 189.5.5.5 MPD C[Port]

The value of C[Port] specified in item 10 of Table 189-9 is the maximum capacitance during POWER\_ON that an MPD can present without requiring extra consideration. This value can be charged to V[MPSE] max by I[Inrush\_MPD] within T[Inrush] min. The value of C[Port] is per unit load, meaning an MPD that consumes more than one unit load can scale C[Port] accordingly. An MPD can have a larger C[Port] but must **(shall?)** actively manage the charging of the capacitance to conform to I[Inrush\_MPD] and P[MPD] once the device has progressed from INRUSH to POWER\_ON.
