P802.3ds D1.0 200 Gb/s per Wavelength MMF PHYs Task Force 1st Task Force review comments

Cl 300 SC 300.7.1 P53 L11 # 25

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

We have TDECQ and TECQ specs but not TDECQcer, the FEC-aware ECQ. P802.3dj is rushing to go to print and TDECQcer might not be fully debugged in their desired timescale, but this follow-up project has a few months longer so it should consider adopting this promising technique.

SuggestedRemedy

Add TDECQcer, copied from P802.3dj.
As it is a standalone spec, unlike OMA (no other spec depends on it), if it doesn't work out it can easily be removed in SA ballot.

Proposed Response Response Status W

PROPOSED REJECT.
TDECQ_CER has been studied in P802.3dj, where repeatability was identified as a limitation. It can be reconsidered once this issue is addressed. Also note that TDECQ_CER acquisition requirements have an impact on TDECQ.

Cl 300 SC 300.7.1 P53 L18 # 26

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

Receivers have more sophisticated equalisers than the 5-tap FFE used in ECQ for 50 and 100 G. Modern receivers tolerate amazingly slow signals in copper links. Measuring transition time relies on measuring the 0 and 3 in OMA, which turns out to be remarkably inconsistent and controversial; it is being studied in P802.3dj. But a slow signal (if it is a problem at all) is identified in a more realistic near best-fit way by the taps in ECQ. This spec has outlived its purpose; at 200 G it is an inaccurate nuisance.
There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

Delete the row. Delete 300.9.12, Transmitter transition time. Delete the row in Table 300-13, Mapping of parameters to test patterns and related subclauses.

Proposed Response Response Status W

PROPOSED REJECT.

P802.3ds D1.0 200 Gb/s per Wavelength MMF PHYs Task Force 1st Task Force review comments

CI 300 SC 300.7.2 P54 L15 # 29

Dawe, Piers Nvidia

Comment Type TR Comment Status D

Sensitivity is defined post-FEC now. There is one FEC per MAC, so it corrects across the group of lanes allocated to that MAC in a multi-lane PMD. In receiver sensitivity measurements, each lane can be tested individually and the error histograms for the lanes are combined according to 802.3dj Annex 174A. So, for multi-lane PMDs, sensitivity is not "each lane", as is pointed out in 300.9.2.

In practice, actual *product* is likely to be qualified as a 1-lane, 2-lane 4-lane *and* 8-lane PMD, so it doesn't make much difference in a factory. But we should be correct because it relates to determining if a deployed link (e.g. 4 lanes) is performing well enough. There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

In lines 15 and 19, delete "each lane"

Proposed Response Response Status W

PROPOSED REJECT.

Address this comment after CRG discussion in P802.3dj.

CI 300 SC 300.9.1 P62 L14 # 30

Dawe, Piers Nvidia

Comment Type TR Comment Status D

The square wave is optional for transition time measurement and not used for anything else in the draft. The transition time spec should be removed (see another comment) and because one cannot reliably measure OMA on the square wave (see presentations by Laurent Alloin) and the square wave is not a valid pattern for OMA measurement already, even if transition time were kept, it should not involve the square wave.

SuggestedRemedy

Delete the row for square wave

Proposed Response Response Status W

PROPOSED REJECT.

P802.3dj D3.0, Table 180-14, indicates use of square wave for wavelength and transmitter transition time. This proposal can be re-submitted against D1.1 if recommended test patterns change during CRG discussion in P802.3dj.

CI 300 SC 300.9.1 P62 L35 # 31

Dawe, Piers Nvidia

Comment Type TR Comment Status D

As discussed in P802.3dj, it may not be feasible to measure OMA, and therefore extinction ratio straightforwardly and accurately with pattern 4, PRBS13Q. In principle this point applies to RIN too, but in the that context, the inaccuracy probably doesn't matter.

SuggestedRemedy

If Pattern 4 is relegated to an approximate method (not normative) or deprecated for OMA and extinction ratio, remove it from the appropriate rows in this (normative) table or add a footnote to explain.

Proposed Response Response Status W

PROPOSED REJECT.

P802.3dj D3.0, Table 180-14, indicates use of pattern 4 (or 6 = SSPRQ) for OMA measurement. This proposal can be re-submitted against D1.1 if recommended test patterns change during CRG discussion in P802.3dj.

CI 300 SC 300.9.3 P63 L28 # 32

Dawe, Piers Nvidia

Comment Type TR Comment Status D

This sentence extends over 4 lines and it is hard to parse. It can be divided cleanly. Also we should be clear whether it's the Bessel-Thomson response that should not exceed, or what. There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

IEEE Std 802.3db has a partial fix but use the wording in IEEE Std 802.3dk: change: at least 1.3×106.25 GHz, and at frequencies above 1.3×106.25 GHz, the response should ... to: at least 1.3×106.25 GHz. At frequencies above 1.3×106.25 GHz, *its* response should ...
Make the equivalent two changes for TDECQ, 300.9.7, p 64 L 16.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Change

"The reference receiver, composed of the combination of the O/E converter and the oscilloscope, has a 3 dB bandwidth of approximately 53.125 GHz with a fourth-order Bessel-Thomson response to at least 1.3×106.25 GHz, and at frequencies above 1.3×106.25 GHz, the response should not exceed -20 dB."

to

"The reference receiver, composed of the combination of the O/E converter and the oscilloscope, has a 3 dB bandwidth of approximately 53.125 GHz with a fourth-order Bessel-Thomson response to at least 1.3×106.25 GHz. At frequencies above 1.3×106.25 GHz, the reference receiver response should not exceed -20 dB."

P802.3ds D1.0 200 Gb/s per Wavelength MMF PHYs Task Force 1st Task Force review comments

CI 300 SC 300.9.3 P63 L28 # 33

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

The choice of fourth-order Bessel-Thomson response is a historical accident. Fifth order has a better phase response and rolls off a bit steeper at high frequencies, which is more realistic. The better roll-off leads to better measurements. This is also true for measurements where reflections at an instrument's electrical connectors are a concern. This is our chance to make the change, as the industry transitions to a new speed and new test equipment.

There is a similar comment against P802.3dj D3.0, although scopes for MMF are not the ones for SMF, so this project can move ahead independently.

SuggestedRemedy

Change fourth-order to fifth-order throughout the draft.

Proposed Response Response Status W

PROPOSED REJECT.

A histogram is a table of value, count pairs. A histogram *window* is a box on the scope screen. Also we should be clear whether it is measured to edges or centres.

There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

Change "histogram spacing" to "spacing of the centers of the histogram windows"

Proposed Response Response Status W

PROPOSED ACCEPT.

CI 300 SC 300.9.7 P64 L27 # 37

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

The apparent TDECQ or TECQ is a very strong function of histogram window spacing. Reducing the spacing from the traditional 0.1 UI does not make the signal any better, but it lowers our guard against signals with a jitter problem. This should be treated very carefully. A narrower histogram window should improve ECQ accuracy/repeatability.

There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

Set the histogram window spacing at 0.09 UI and width at 0.02 UI (if sampling at 50 s/UI is feasible) or 3/32 = 0.09375 UI and 0.03125 UI (if sampling at 32/UI is preferred or 0.09375, 0.015625 if 64/UI is preferred).

CI 300 SC 300.9.7.1 P65 L15 # 39

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

The main tap minimum 0.8 allows an excessively over-emphasised signal which can cause BER floor issues as shown in kimber_3dj_01a_2505. This is not affected by the addition of the DFE which operates when the signal is slow and the main tap is >1. Relative to the signalling rate, 200G silicon is slower than 100G or 50G silicon, and 200G receivers are designed to cope well with such signals. Designing them to cope with badly set-up signals as well would be wasteful. We allow somewhat less than 1 for tolerancing, but 20% off is too much. A properly revised overshoot spec can catch some of these signals, but we should write down what we mean here in any case.

There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

Change 0.8 to 0.9.

Proposed Response Response Status W

PROPOSED REJECT.

Address this comment after CRG discussion in P802.3dj.

CI 300 SC 300.9.7.1 P65 L19 # 40

Dawe, Piers

Nvidia

Comment Type TR Comment Status D

The tap weights were created by drawing limit lines that passed a population of SMF transmitters, some time ago. The main tap maximum and the other FFE tap limits need review, taking the DFE into account and considering what is cost-effective for receivers. In particular, the we will see less of the characteristic alternating FFE tap weights because the DFE can do that job better, so taps 4+ should be tightened up. There is a similar comment against P802.3dj D3.0, although there might be a reason to have different limits for this PMD family.

SuggestedRemedy

Review the tap weight limits and make changes as appropriate.

Causal vs. anticausal pulse shapes

This pre-post equalizer coefficient difference limit $|w(1)/w(0) - b(1) - w(-1)/w(0)|$ seeks to keep the attack and decay of the signal pulse similar. Yet the evidence from https://iee802.org/3/dj/public/25_05/chayeb_3dj_01_2505.pdf#page=8 and 9, plotted in https://iee802.org/3/dk/public/2511/3dk_dawe_2511_1.pdf, shows that for a real receiver, the situation is very far from symmetrical; relatively fast attack (c(-1) close to zero) and slow decay (c(+1) strongly -ve) is tolerated well, but the opposite is not.

There is a similar comment against P802.3dj D3.0.

SuggestedRemedy

Cl 300 SC 300.9.7.1 P65 L28 # 42

Dawe, Piers Nvidia

Comment Type TR Comment Status D

Setting the "DC gain" to 1 worked when the 5-tap DFE was shorter than the 6- or 7-UI run length for defining OMA. Now that the equaliser is longer than the runs, it doesn't work any more; it contributes to forcing the ECQ optimiser to sub-optimal solution and making acceptable signals look bad. "DC gain" is no longer a valid concept; the signal is AC coupled anyway, there is no response at DC, and what there is may be significantly different to typical or "average". It is a distraction.

This comment comes out of the study of OMA measurement problems in P802.3dj.

SuggestedRemedy

Change "Equalizer DC gain" to "The sum of equalizer coefficients w(i) from i = -3 to 3".
Delete the footnote which is no longer needed.

Cl 300 SC 300.9.7.1 P65 L34 # 43

Dawe, Piers Nvidia

Comment Type TR Comment Status D

The DFE tap limit might be too weak. Copper clauses use a limit of 0.85, but with a different definition. Note that the way the DFE coefficient is defined in P802.3dj is expected to change to be more like the one in COM; I believe that 0.4 would be 0.667 in the new definition (needs checking). Note also that an emulation of the fibre bandwidth is included in TDECQ for MMF.

There is a similar comment against P802.3dj D3.0, although there is a different DFE limit for this PMD family.

SuggestedRemedy

Set the limit to at least 0.7 on the new scale or as defined in copper clauses and COM.

Comment Type TR Comment Status D

Note that in P802.3dj, it is proposed to change the hit ratio for overshoot and similar to 1e-4.

SuggestedRemedy

Change 1e-3 to 1e-4, here and in 300.9.10 Transmitter power excursion

Comment Type TR Comment Status D

The sinusoidal interferer in SRS is causing problems. There is a comment in P802.3dj to impose a minimum frequency, but that is not enough of a fix.

SuggestedRemedy

Set a limit for the amount of SI, at pk-pk max 1/15 of OMAouter, and/or use a near line-rate second PRBS (different length) instead of a single tone.
